Rosedale Products, Inc. is a leading technology developer in the field of liquid filtration systems and waste minimization products for customers around the globe. Our engineering achievements have produced an exceptional product line that includes high performance filtration solutions for multiple industries.

Rosedale technicians help customers find high-performing, cost effective approaches to filtration needs.

Rosedale Products, Inc. is headquartered in Ann Arbor, Michigan, and has a worldwide sales and distribution network in place.

Rosedale Filter Housings

Rosedale Filter Housings come in many sizes and styles, and can serve as bag filters, cartridge filters or basket strainers. Lids are easily removed without special tools, and the element is easily cleaned or replaced.

Features

- Housings NSF 61 listed on most models
- Single, multi-basket, cartridge, duplex and multiplex units available
- All units are available in U.S. standard and metric connections
- Low pressure drops
- Permanently piped housings
- Sure-sealing covers, opened without special tools
- Carbon steel, stainless steel (304 or 316), or all-plastic (polypropylene or PVDF) construction
- Large-area, heavy-duty baskets
- Easy to clean!
- Adjustable-height legs (single units) or low profile (multi units)
- Differential pressure indicators (optional)
- ASME code stamp available
- Liquid displacers that minimize product loss during basket or bag removal (optional)
- Dual stage straining/filtering (optional)

Certified to NSF/ANSI 61

MULTI-BAG MODELS offer a wide range of flow capacities and contaminant-holding capabilities. They contain 2 to 23 bags and can handle flows to 4500 gpm. Multi-cartridge housings contain 2-205 cartridges.

Model QII 24

Duplex Model 18
Bag System

Model 12
Cartridge Housing

Low Pressure
Model 4

High Pressure
Model 4

DUPLEX MODELS are two housings that are piped together for alternate use providing continuous operation, reducing operating costs. Flow is switched between the filter housings, allowing one side to be serviced while the other is in use. One lever actuates all valves simultaneously. All Duplex Models are also available in a trouble-free automatic service system.

CONSTRUCTION MATERIALS

All housings specified can be ordered in carbon steel, 304 or 316 stainless steel. Special alloy materials or teflon lined housings are optional. Various seal materials, including Buna, Ethylene Propylene, Viton®, and Teflon are available for most filter housings.

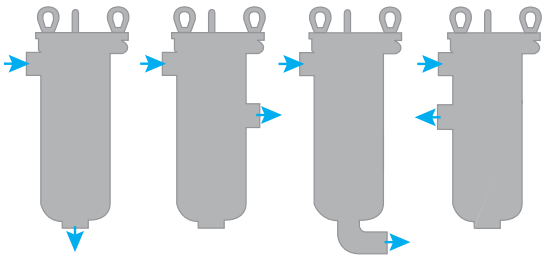
All baskets and cartridge internals are made of stainless steel. 304 stainless will be supplied with carbon and 304 housings, 316 stainless with 316 housings.

NOTE: For the anatomy of Single-bag filter see page 3.
For the anatomy of Multi-bag filter see page 38.

COVERS for high capacity basket strainers, cartridge filters and bag filters are secured by eyenut assemblies. Some models can be ordered with a quick-opening clamp cover.

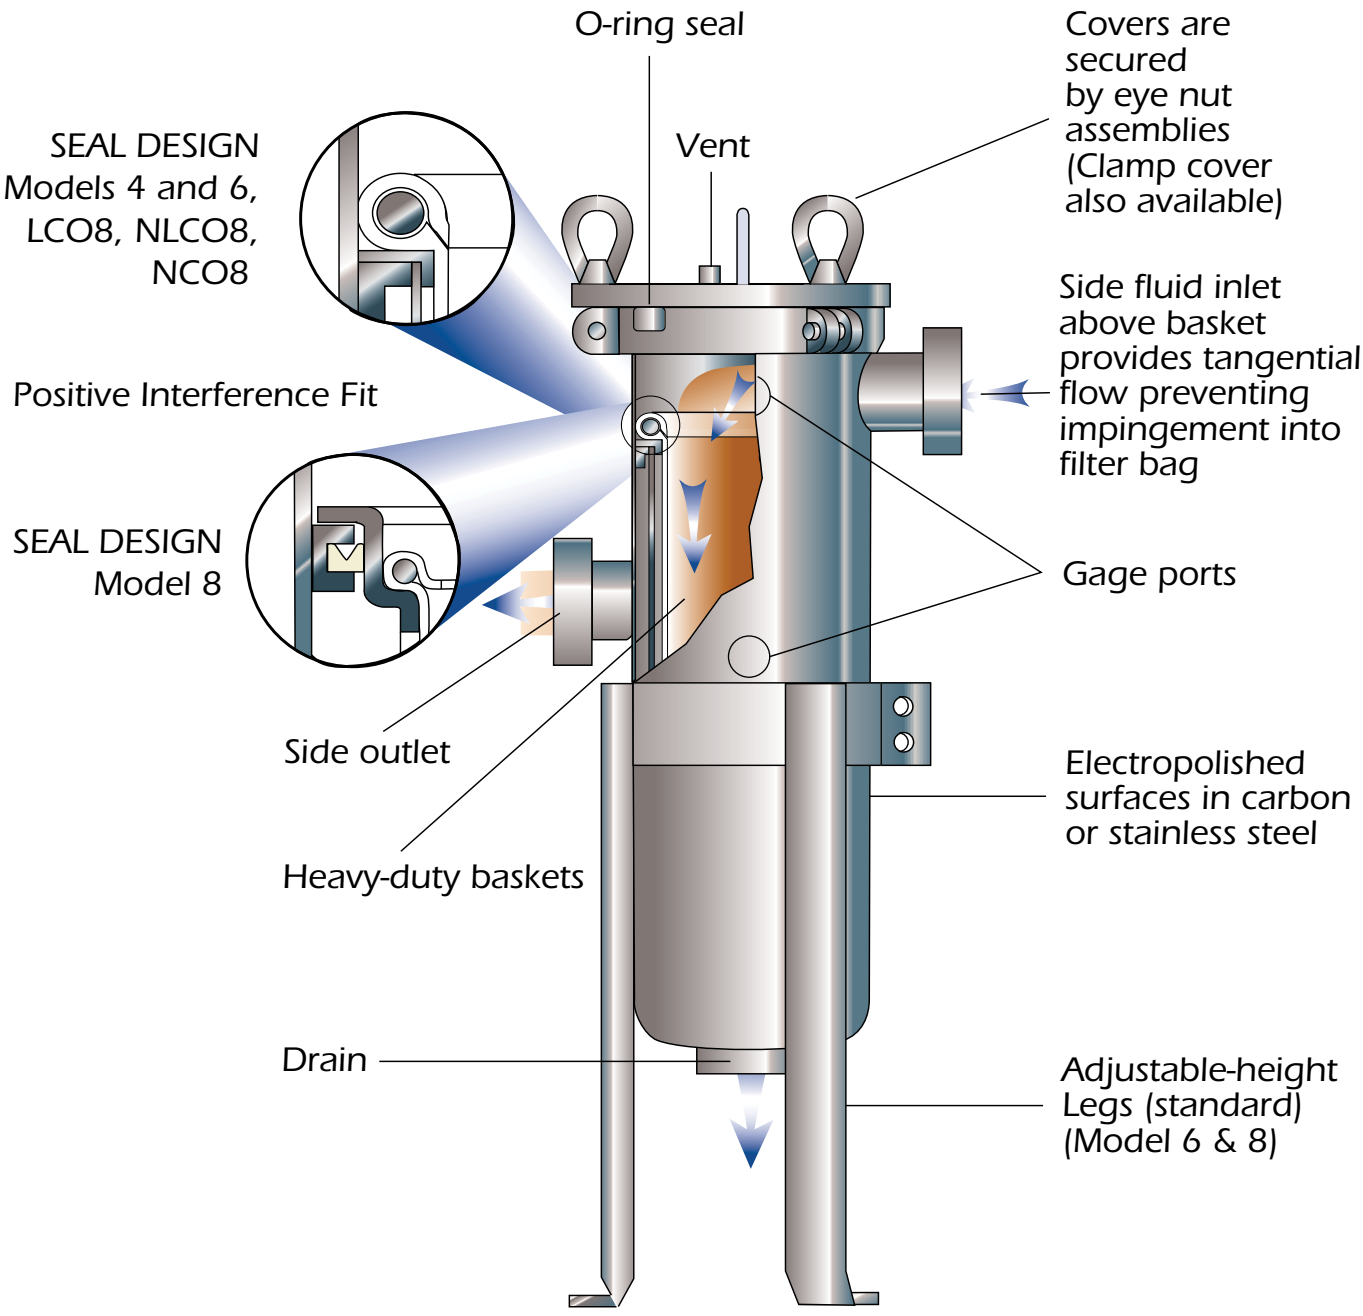
CONVENIENT PIPING ARRANGEMENTS are available to fit most piping situations. Below are standard options for Models 4, 6, and 8. Flange or NPT connections are standard on all housings, and are also available in metric.

For Model 4, 6, and 8



Style 1 Style 2 Style 3 Style 4 (Style D)

Single-Bag Filter Features



Typical Filter

Model 4 Basket Strainer and Bag Filters

Strainers or Bag Filters:
Your Choice!

Model 4 strainer/filter housings are made in 2 sizes and 4 pressure ratings. In all cases, covers are easily removed without special tools, and the basket or bag is easily cleaned or replaced.

Covers are secured by three eyenut assemblies. One of them acts as a hinge, when the cover is opened.

Features

- Low pressure drops
- Permanently piped housings
- Covers are O-ring sealed
- Carbon steel, or stainless steel (304 or 316) construction for housings
- All housings are electropolished to resist adhesion of dirt and scale
- Easy to clean!
- Adjustable-height legs, optional
- O-ring seals: Buna N, EPR, Viton®, Teflon®
- ASME code stamp available on select models
- Liquid displacers for easier servicing
- Four pressure ratings: 200 psi (with clamp cover) and 150, 300, or 500 psi (with eyenut cover)
- Duplex units are available
- Pipe sizes 3/4 thru 2-inch, NPT or flanged (standard 150 class flange)
- Two basket depths: 6, or 12 inches (nominal)

Options

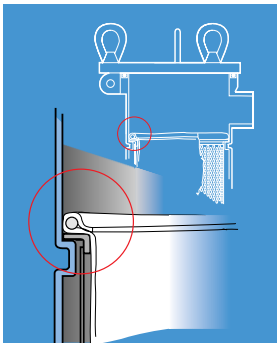
- Bag filter hold-down devices
- Sanitary construction
- Different outlet connections
- Higher pressure ratings
- Extra-length legs
- Heat jacketing
- Epoxy coating
- Displacers
- Magnets

Choosing A Basket Strainer Or Bag Filter

Choose between straining (removing particles down to 74 micron size) or filtering a fluid (removing particles down to 1 micron). This will direct you to choose the correct basket when ordering.

Operation

Unfiltered liquid enters the housing above the bag or basket and flows through. Solids are contained inside the bag or basket, where they're easily and completely removed when the unit is serviced. Fluid bypass around the basket is prevented because the filter bag seals radially against the housing inside diameter. A single cover gasket is used to seal the opening, and covers can be installed and removed without tools.



Pressure Drop Data

Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi when they are clean. Higher pressure drops may be tolerated when contaminant loading is low. Bag change-out should occur at 15 psid.

The pressure drop data is accurate for all housings with strainer or bag filter baskets. When filter bags are added, total pressure drop becomes the sum of the pressure drop as determined by the steps below.

Follow these easy steps:

1. Using the desired pipe size and approximate flow rate, determine the basic pressure drop from the appropriate graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table. This is the adjusted (clean) pressure drop for all baskets, without filter bags.
3. Add the pressure drop for the bag filter.

Note: Filter bags are specified separately. See page 150.

Clamp covers to the left and center, and eyenut cover to the right.

Bag Style and	Viscosity, cps								
	1 (H_2O)	50	100	200	400	600	800	1000	2000
All unlined baskets	.65	.85	1.00	1.10	1.20	1.40	1.50	1.60	1.80

300 psi (flanged) = **300**
500 psi (NPT) = **500**

HOUSING MATERIAL
Carbon steel = **C**
304 stainless steel = **S**
316 stainless steel = **S316**

ASME CODE STAMP
C = Code

DISPLACER
D = Displacer

BASKET, MEDIA SIZE
No symbol if type B basket was selected
Perforation diameters (for type P baskets) 1/4, 3/16, 9/64, 3/32, 1/16

Mesh sizes (for type M and BM baskets) 20, 30, 40, 50, 60, 70, 80, 100, 150, 200

BASKET TYPE
PB = Filter bag basket, 9/64 perforations[3]
P = Strainer basket, perforated metal
BM = Filter bag basket, perforated, mesh lined[3]
M = Strainer basket, perforated, mesh lined with spring handle
HWM = Filter bag basket, heavy wire mesh[3]

BASKET SEAL
N = No seal (with bag type baskets)
S = Seal required (on strainer type baskets)

COVER SEAL
B = Buna N
E = Ethylene Propylene
V = Viton® Fluoroelastomer

Eyenut Cover Only
TEV = Teflon® Encapsulated Viton®
TSW = Teflon® (solid white)

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are specified separately. See page 150.
4. 150 psi unit has 150 class flanges. 300 psi unit has 300 class flanges. 200 and 500 unit available in NPT only.

Model 6 Basket Strainer and Bag Filters

Strainers or Bag Filters:
Your Choice!

Model 6 strainer/filter housings are made in 3 sizes and 3 pressure ratings, and can serve as basket strainers (for particle retention down to 74 micron size) or as bag filters (for particle retention down to 1 micron size). In all cases, covers are easily removed without special tools, and the basket or bag is easily cleaned or replaced.

Features

- Low pressure drops
- Permanently piped housings
- Covers are O-ring sealed
- Carbon steel, or stainless steel (304 or 316) construction for housings
- All housings are electropolished to resist adhesion of dirt and scale
- Easy to clean!
- Adjustable-height legs, standard
- O-ring seals: Buna N, EPR, Viton®, Teflon®
- ASME code stamp available
- Three pressure ratings: 150, 210 or 300 psi
- Duplex units are available
- Can provide 3.4 square feet of basket or bag surface area without need for ASME code construction
- Three basket depths: 12, 18, or 30 inches (nominal)
- Special alloys

Options

- Sanitary construction
- Different outlet connections
- Higher pressure ratings
- Extra-length legs
- Heat jacketing
- Liquid displacers for easier servicing

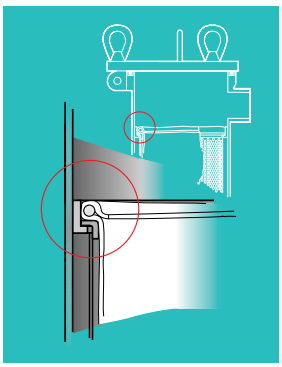
Covers are secured by three eyenut assemblies. One of them acts as a hinge, when the cover is opened.

Choosing a Basket Strainer or Bag Filter

Choose between straining (removing particles down to 74 micron size) or filtering a fluid (removing particles down to 1 micron). This will direct you to the correct basket when ordering.

Operation

Unfiltered liquid enters the housing above the bag or basket and passes down through them. Solids are contained inside the bag or basket, where they are easily and completely removed when the unit is serviced.



Fluid bypass around the basket is prevented because the outside diameter of the filter bag seals against the housing inside diameter.

A single cover gasket is used to seal the opening, and covers can be installed and removed without tools.

Pressure Drop Data

Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi, when they are clean. Higher pressure drops may be tolerated, when contaminant loading is low. Bag change should occur at 15psid.

The pressure drop data is accurate for all housings with strainer or bag filter baskets. When bag filters are added, total pressure drop becomes the sum of the pressure drop as determined by the steps below, plus the pressure drop through the bag as defined in Rosedale Filter Bag section.

Follow these easy steps:

1. Using the desired pipe size and approximate flow rate, determine the basic pressure drop from the appropriate graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table. This is the adjusted (clean) pressure drop for all baskets, without bag filters.
3. Add the pressure drop for the bag filter.

Note: Filter bags are specified separately. See page 150.

	Viscosity, cps								
	1 (H_2O)	50	100	200	400	600	800	1000	2000

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are specified separately. See page 150.
4. 150 psi unit has 150 class flanges. 300 psi unit has 300 class flanges. 210 psi unit available only in NPT.

Model 8 Basket Strainer and Bag Filters

Strainers or bag filters:
Your choice!

Model 8 strainer/filter housings are made in 2 sizes and 2 pressure ratings, and can serve as basket strainers (for particle retention down to 74 micron size) or as bag filters (for particle retention down to 1 micron size). In all cases, covers are easily removed, without tools, and the basket or bag is easily cleaned or replaced.

Features

- NSF 61 listed
- Low pressure drops
- Permanently piped housings
- Covers are O-ring sealed
- Carbon steel, or stainless steel (304 or 316) construction for housings
- All housings are electropolished to resist adhesion of dirt and scale
- Easy to clean!
- Adjustable-height legs, standard
- Large-area, heavy-duty baskets
- O-ring seals: Buna N, EPR, Viton®, Teflon®
- ASME code stamp available
- Two pressure ratings: 150 and 300
- Duplex units are available
- Pipe sizes 3/4 thru 6-inch, NPT or flanged
- Two basket depths: 15 or 30 inches (nominal)

Certified to NSF/ANSI 61

Options

- Sanitary construction
- Different outlet connections
- Higher pressure ratings
- Extra-length legs
- Heat jacketing
- Adapters for holding filter cartridges.
- Liquid displacers for easier servicing
- Can be fitted with an adapter to hold cartridge filter elements

Choosing A Basket Strainer Or Bag Filter

Choose between straining (removing particles down to 74 micron size) or filtering a fluid (removing particles down to 1 micron). This will direct you in selecting the correct basket when ordering.

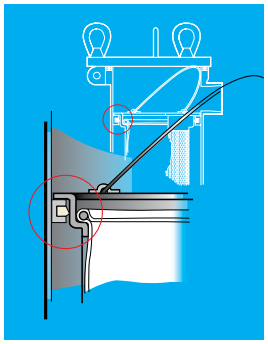
Dual Stage Straining/Filter

All Rosedale Model 8 housings can be supplied with a second, inner basket, which is supported on the top flange of the regular basket. Both baskets can be strainers (with or without wire mesh linings) or both can be baskets for filter bags. They can also be mixed: one a strainer basket, the other a filter bag basket. Dual-stage action will increase strainer or filter life and reduce servicing needs.

Operation

Unfiltered liquid enters the housing above the bag or basket and flows through. Solids are contained inside the bag or basket, where they are easily removed when the unit is serviced.

A basket bail is pushed down by the closed cover to hold the basket against a positive stop in the housing. A radial seal prevents bypass of unfiltered liquid.



Pressure Drop Data

Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi, when they are clean. Higher pressure drops may be tolerated, when contaminant loading is low. Bag change occurs at 15 psid.

The pressure drop data is accurate for all housings with strainer or filter bag baskets. When filter bags are added, total pressure drop becomes the sum of the pressure drop as determined by the steps below.

Follow these easy steps:

1. Using the desired pipe size and approximate flow rate, determine the basic pressure drop from the appropriate graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table. This is the adjusted (clean) pressure drop for all baskets without filter bags.
3. Add the pressure drop for the bag.

Note: Filter bags are specified separately. See page 150.

BM	= Filter bag basket, perforated, mesh lined[3]
M	= Strainer basket, perforated, mesh lined
HWM	= Filter bag basket, heavy wire mesh[3]

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are specified separately. See page 150.
4. 150 psi unit has 150 class flanges. 300 psi unit has 300 class flanges.
5. 300 psi design only (6 bolt lid).

Model LCO Bag Filter Housings

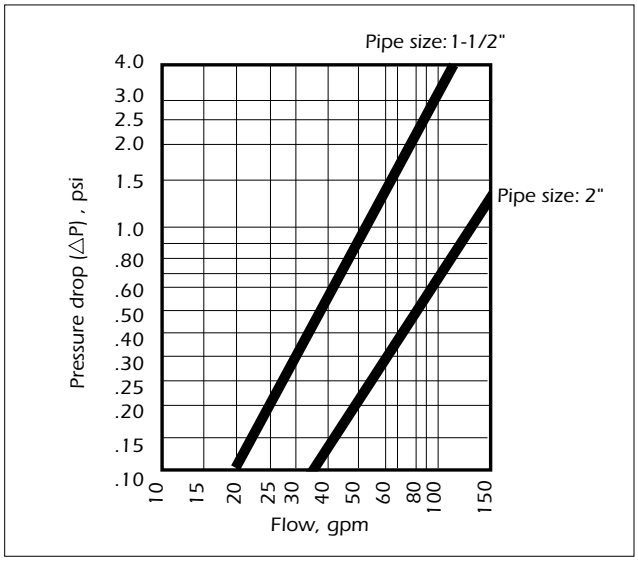
Low cost filter housings for flow rates to 100 gpm*

These high-capacity bag filters are low in cost and offer more dirt holding capacity. These housings are made from carbon steel or stainless steel. They use a clamp cover that is easily removed, reducing time spent on cleaning and bag replacement. Housings also utilize our Unistyle design offering you the option of a side or bottom outlet. There is a 1-1/2-inch or 2-inch inlet and outlet on the side, with a 1-1/2-inch or 2-inch plugged drain at the bottom of the housing. The outlet can easily be changed to the bottom by merely moving the plug from the drain to the side outlet.

Features

- Permanently piped housings are opened without special tools
- Quick opening cover
- Carbon or stainless steel housings
- Large area bag and basket for greater dirt-holding capacity
- O-ring seals: Buna N, EPR and Viton®
- Adjustable-height tripod legs
- 125 psi rated housing
- Basket material is compatible with housing
- Bag surface area is 5.6 square feet (LCO8), and 2.0 square feet (LCO6)
- Uses number 12 size bags (LCO8), and number 8 size bags (LCO6)
- 2-inch NPT ports (LCO8)

Note: Filter bags are specified separately.
See page 150.



*Based on housing only. Fluid viscosity, filter bag used, and expected dirt loading should be considered when sizing a filter.

Model NCO and NLCO Bag or Cartridge Filter Housings

Low cost filter housings for flow rates to 100 gpm*

NCO high-capacity bag filters offer an exceptional value in basic filtration applications. Offered in trade sizes 1, 2, and 12, the NCO is also available with our Platinum 700 cartridge series.

NCO housings provide large dirt-holding capacity combined with a rugged design rated to 150 psi. The housings incorporate an eyenut cover that is easily removed, reducing time spent on bag or cartridge change-out. The NCO bag housing offers versatility for any piping arrangement, utilizing our unistyle design (side and bottom outlet). Two connection sizes are available for both bag and cartridge filters.

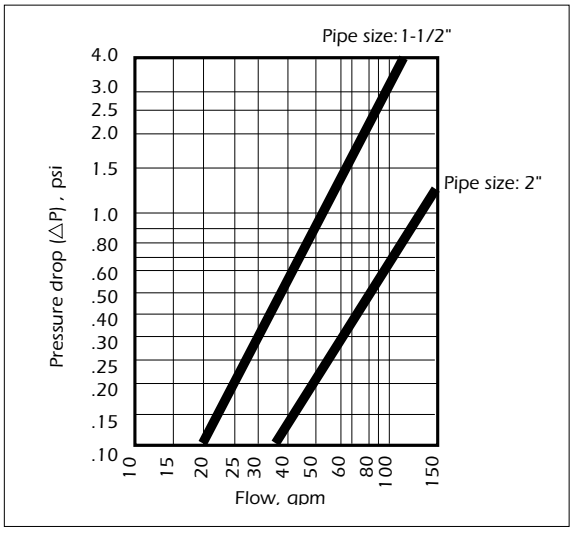
The NCO housings are electropolished creating a smooth, easy-to-clean surface. A variety of filter bags or cartridges (rated 0.5µ absolute to 100µ nominal) can be utilized in this housing. Keep your filtration process cost effective without sacrificing quality.

Features

- Permanently piped housings are opened without special tools
- Carbon or stainless steel housings
- Covers are O-ring sealed
- O-ring seals: Buna N, EPR and Viton®
- 150 psi rated housing
- Heavy-duty basket, over 50% open area
- Uses standard number 1, 2 or 12 size bags and 500 or 700 series cartridges

Note: Filter bags are specified separately.
See page 150.

- Filter selection surface area is:
  2.3 square feet (number 1 size bag),
  4.4 square feet (number 2 size bag),
  5.6 square feet (number 12 size bag)
  50 square feet (500 series cartridge)
  100 square feet (700 series cartridge)
- 1-1/2-inch or 2-inch NPT inlet and outlet
- 1/4-inch NPT vent connection
- Adjustable leg assembly



*Based on housing only. Fluid viscosity, filter bag used, and expected dirt loading should be considered when sizing a filter.

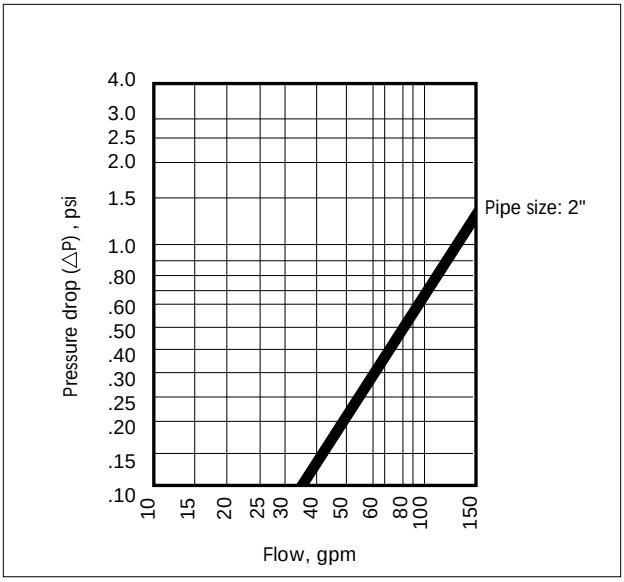
Model 8-125 psi Bag Filters

Low cost filter housings for flow rates to 100 gpm*

These high-capacity bag filters are very low in cost and offer large dirt holding capacity. These housings are made from carbon steel or stainless steel. They use a clamp cover that is easily removed, reducing time spent on bag change-out. The O-ring seal on the cover ensures a seal. This housing also utilizes our Unistyle design offering the option of a side or bottom outlet. There is a 2-inch outlet on the side with a 2-inch plugged drain at the bottom of the housing. The outlet can easily be changed to the bottom by merely moving the plug from the drain to the side outlet.

Features

- Permanently piped housings are opened without special tools
- Quick opening cover
- Carbon or stainless steel housings
- Adjustable-height tripod legs
- O-ring seals: Buna N, EPR and Viton®
- 125-psi rated housing
- Basket material is compatible with housing
- Uses standard number 2 size bags and baskets
- Bag/Basket surface area is 4.4 square feet
- 2-inch NPT ports



* Based on housing only. Fluid viscosity, filter bag used, and expected dirt loading should be considered when sizing a filter.

Aluminum Housings

Spark Free, Heavy Duty Housings!

Economical aluminum AL Series housings for commercial, industrial and process applications. Aluminum can be used in place of carbon steel, stainless steel or plastic in many applications with superior results. It is especially effective in water and water based applications such as machine tool coolants and cooling towers. Also ideal for diesel, oils, and fuels, as well as many others.

FEATURES

- 3/4" through 3" pipes sizes
- NPT connections
- Light weight lid with handle
- O-ring sealed
- Max temp. 250°F
- Pressure ratings to 300 PSI
- Strainer baskets optional
- 5 outlet styles
- Stainless steel filter bag baskets
- Tripod legs

STRAINERS OR BAG FILTERS

High-Capacity Strainer Baskets

High-Capacity Filter Bags

All housings are available with perforated or mesh lined cleanable strainer baskets in place of filter bag baskets. These baskets can be perforated or mesh lined, with handle.

Filter bag sizes are industry standard sizes, and are offered in polyester, polypropylene and nylon materials in micron ratings of 1 to 1000. Filter bags are ordered separately.

Housing	Bag Size	Sq. Area	Maximum Flow	
			GPM	M^3/H
Model 50	3	0.5	20	4
	4	1.0	40	8
Model 66	7	1.5	60	12
	8	2.0	80	16
	9	3.0	120	24
Model 80	1	2.0	80	16
	2	4.5	180	36

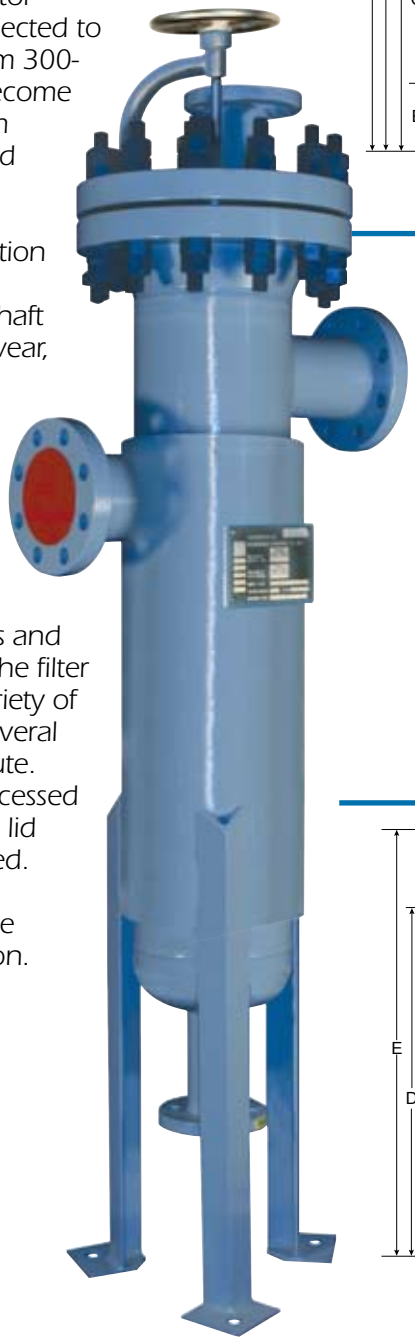
Heat Transfer Fluid Filtration

300°F to 700°F

Heat transfer fluids are used for the indirect heating of processes by circulating the fluid between hot oil boilers, molds, tanks, extruders, and reactor vessels. The fluids are subjected to temperatures ranging from 300-700°F. These fluids can become contaminated from system construction, millscale, and oxidization by-products resulting in the formation of sludge. This contamination can cause operational problems such as pump shaft seal leakage, valve stem wear, plugging of heat exchangers and flow passages. Rosedale's HT Line of filters can solve your thermal fluid contamination problems. Particle removal is offered via glass fiber or stainless steel cartridges and wire cloth lined baskets. The filter vessels are offered in a variety of pipe sizes with flows to several hundred gallons per minute. The filter cartridges are accessed through an easily opened lid and can quickly be serviced. Duplex and multiplex arrangements are available for uninterrupted operation.



Features

- ANSI class 150 design
- Temperature ratings of 285 PSI @ 100°F to 85 PSI @ 700°F
- Housings available in carbon steel, 304, and 316 stainless steel
- Covers blind fig

High-Pressure Filtration

Bag or Cartridge Housings
740/1440 PSIG

Rosedale High-Pressure filter housings are the ideal way to meet your needs for oil and gas systems.

The bolted closure system assures a positive seal during operation, and changout is with the davit arm assembly.

The versatile Rosedale system allows you to use filter bags for coarse filtering, or high surface area pleated cartridges for heavy solids loading applications. Inside-out flow design contains solids inside the bag or cartridge, and prevents downstream contamination. The horizontal configuration can use 40" or 60" long cartridges.

Features

- ANSI class 600 design
- Housings available in carbon steel, 304, and 316 stainless steel
- Horizontal or vertical mounting
- ASME code stamp

Industries

4-inch = **4F**
6-inch = **6F**

OUTLET STYLE
Side / Bottom = **1**
Side / Side = **2**

ASME CODE STAMP
C = ASME Code Stamp

MEDIA TYPE
R = 7.20 Rosedale
S = 6.32 HF
B = Filter bag

COVER SEAL
F = Flexitalic

HOUSING MATERIAL
C = Carbon steel
S = Stainless steel
S316 = 316 Stainless steel

PRESSURE RATING
740 = 740 PSIG @ 100°F
1440 = 1440 PSIG @ 100°F

Model 82 Dual Capacity Bag Filter And Basket Strainer

Extra capacity at higher flow rates!

Rosedale dual capacity housings can serve as either basket strainers or bag filters. Covers are easily removed, without tools, and the basket or bag is quickly and easily cleaned or replaced. Rosedale's bag-sized pleated cartridges will provide even greater dirt-holding capacity (see page 150).
Low price, greater dirt holding capacity, and higher flow rates make the Model 82 a very cost-efficient choice!

Features

- Low pressure drops
- Permanently-piped housings
- Covers are O-ring sealed
- Carbon steel or stainless steel (304 or 316) housings
- Housings are electropolished to resist adhesion of dirt or scale
- Adjustable-height legs
- For flow rates to 440 gpm
- ASME code stamp available
- Large-area, heavy-duty baskets
- Dual stage straining/filtering

Options

- Higher pressure ratings
- Extra-length legs
- Heat jacketing
- Liquid displacers for easier servicing

Basket Data

(each basket, two baskets total)

* Based on housing only. Fluid viscosity, filter bag used, and expected dirt loading should be considered when sizing a filter.

Dimensions are reference only and should not be used for hard plumbing. Consult factory for certified drawings.

The All Plastic PVDF/ Polypro Model 8 Bag Filter Housing

Excellent for use in pure, ultra-pure, and corrosive applications

Rosedale's Generation II filter housings incorporate a unique one piece, seamless body that handles flows to 100 gpm. It is rated to 100 psi at 150°F, and offers excellent resistance to corrosion. In addition Rosedale has added new features:

Features

- All molded construction
- 2-inch flat face flange connections
- Unistyle piping configuration (side and/ or bottom outlet)
- Accepts all number 2 sized bags or 500 Series Cartridges (down to 0.5µ absolute)
- Wide selection of cover o-ring materials
- External cover and pressure threads with plug
- Hold down assembly

Options

- Cover vent and drain valve
- Duplex and multiplex arrangements available
- Leg assembly (stainless steel)
- Pressure differential instrumentation
- Convertible 700 Series Cartridge (see page 181)
- Also available in PVDF

Design Details

An easy to remove cover and basket make bag change-out quick, clean and simple. No special tools are needed, and the filter is back in service in a matter of minutes. The cover threads are external, and have no contact with the process fluids to prevent product accumulation. For extra strength the cover features buttress-style threads.The housing is complete with a cover vent, drain and gage port connections. The gauge connections allow for the use of Rosedale differential pressure indicating equipment that assist in determining bag change-out. This can be accomplished by utilizing our pressure gauges, switches options. It's versatile unistyle design, side or bottom outlet, makes piping easy in any arrangement.

Construction

This durable, corrosion resistant design is constructed from special polymer compounds. The Polypro housing is molded of reinforced chemically coupled polypropylene homopolymer. The addition of a UV stabilizer makes it suitable for outdoor use.

Plastic model base shown above. Also available for the Platinum 700 Series cartridge - See page 181.

How To Order

Build an ordering code as shown in the example

Generation II Polypro housings are designed to accept all number 2 size elements, including our standard bags, bag-sized pleated cartridges, Surfaceplus, and the absolute-rated Platinum 500 series. The elements are rated from 0.5 micron absolute (99.98% efficiency or ß5000) to 800 micron nominal. See page 150 for media selection.

Model OT Bag Filter Housing

Guarantees a 360° positive seal for flows to 100 gpm*

Performance

The Model OT filter provides optimum filtration performance when combined with our high capacity filter bags. Our unique design ensures a 360-degree positive seal and media compression, eliminating the potential for bypass. Unfiltered liquid and debris does not accumulate above the filter bag and contaminate the clean fluid area during change-out. Fluid passes through the bag from inside to outside.
The Rosedale Model OT filter ensures an even flow into the filter bag where contaminate is contained for easy disposal.

Construction

The Model OT housing is a durable, high capacity filter with an uncompromising welded construction to meet ASME Section VIII Code requirements. The cover is hinged and fastened with swing bolts for quick access and easy bag change-out. They have a high quality electropolished finish to resist adhesion of dirt and scale, making routine maintenance fast and simple.

Model OT filters are available in two sizes with flanged or threaded connections. Customize with several options, including gauges and switches. A wide range of filter bags or cartridges (rated 0.5µ absolute to 100µ nominal) with various surface areas can be utilized in this housing.

Features

- Accepts all major competitive brands of bags
- Permanently piped housings are opened without special tools
- Carbon or stainless steel housings
- Covers are O-ring sealed
- All sealing surfaces are blancher ground
- O-ring seals: Buna N, EPR, Viton® and Teflon®
- 150 psi rated housing
- ASME Code Stamp available
- Uses standard #1, #2 or 500 series PL cartridges
- 1/4-inch NPT gauge ports and vent connection
- 1/2-inch NPT drain connection
- Adjustable-height tripod leg assembly

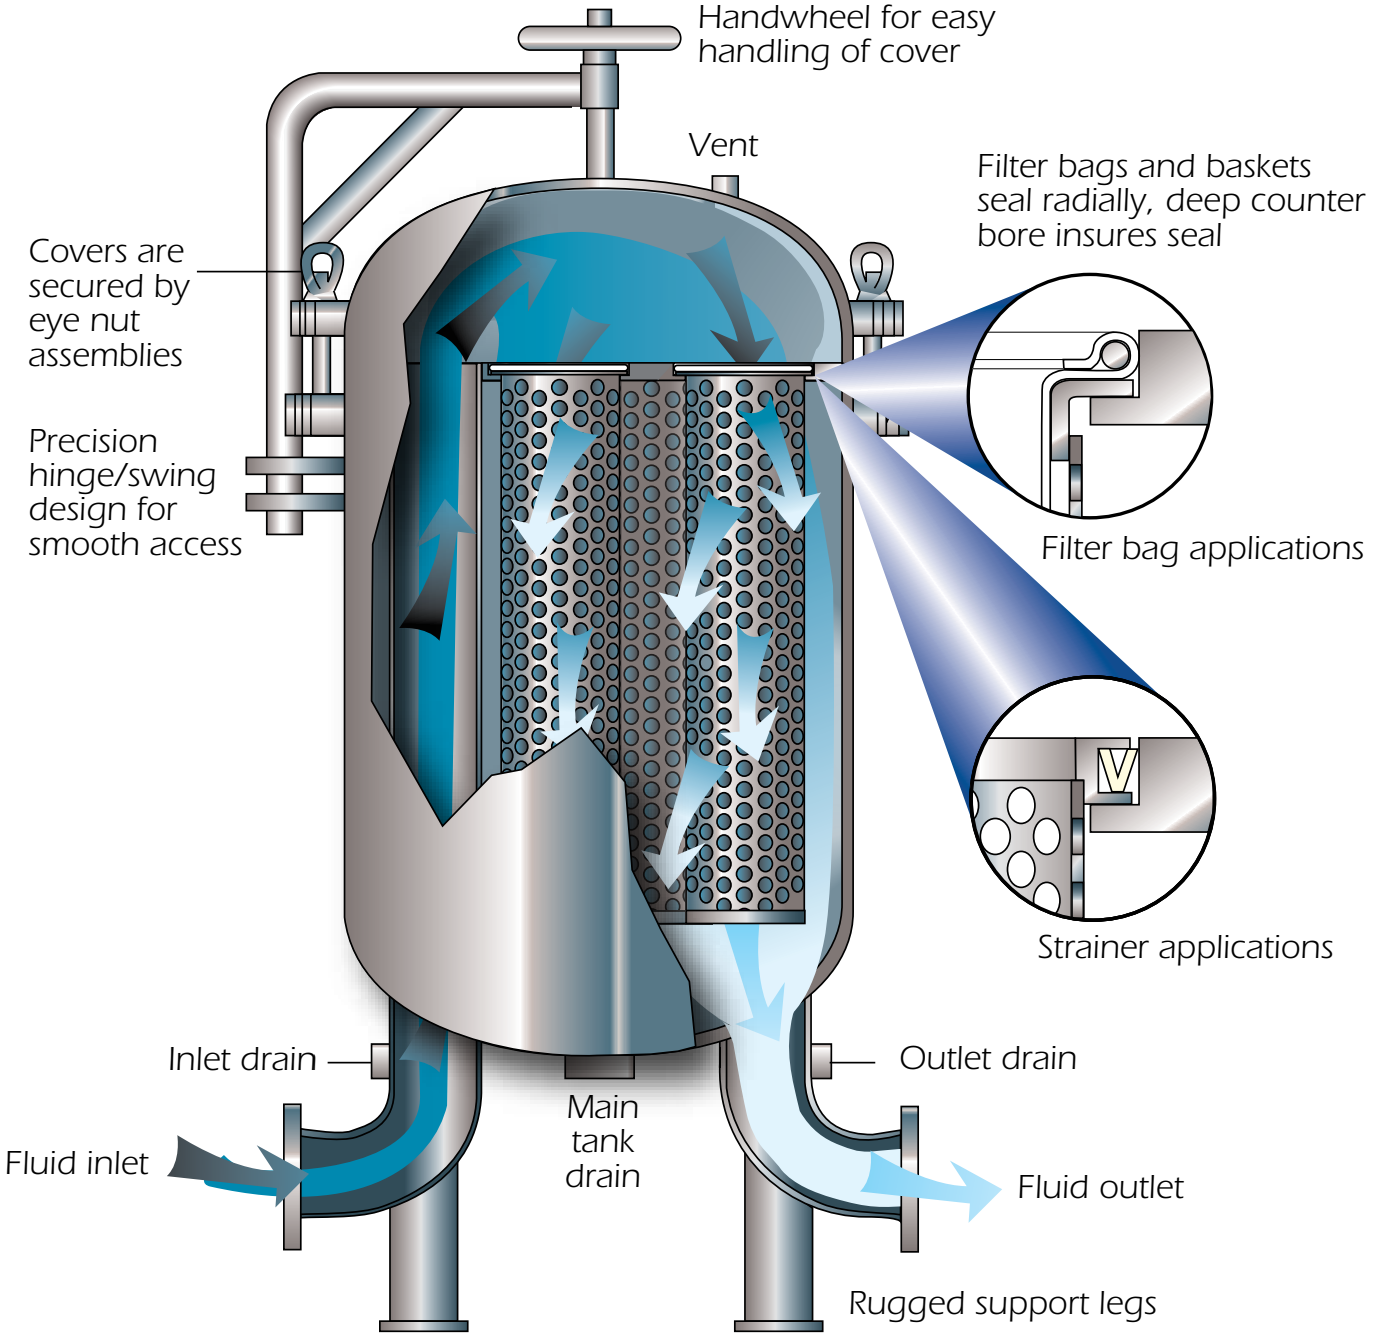
Multi-Bag Filter Standard Features



Typical Multi-basket Strainer and Multi-bag Filter Housing

Unfiltered fluid enters the bottom of the housing and flows into the open area under the dome of the cover. Flow is distributed uniformly through the bags or baskets, where they can be removed easily and completely.

Multi-Basket Strainers and Multi-Bag Filters

These multi-basket strainers and bag filters offer a wide range of flow capacities and contaminant-holding capabilities. They contain from 2 to 23 baskets.

To serve as a strainer, a unit is ordered with perforated stainless steel baskets (mesh-lined if desired). When ordered as a filter, it's fitted with perforated stainless steel baskets designed to hold disposable or cleanable filter bags. Accepts industry-standard #1 and #2 size filter bags, or 500 series pleated cartridges (see page 150).

The standard pressure rating for all models is 150 psi. All housings can be supplied with an ASME code stamp, if required.

Features

- NSF 61 listed
- Multiple housing styles available (standard, quick access, low profile, hinged)
- Permanently piped housings are opened without tools and without disturbing the piping
- Machined cover gasket groove provides positive O-ring sealing
- Carbon steel, 304 or 316 stainless steel construction housings
- Large-area, 30 inch deep, heavy-duty, 9/64 inch perforated baskets
- Easy to clean
- Low pressure drop
- Four cover seal materials: Buna N, Ethylene Propylene, Viton®, and Teflon®
- Pressure rating 150 psi
- Flanged connections for 2 through 12 inch pipe
- Vent, drain and gage connections

Options

- ASME code stamp
- Higher pressure ratings
- Corrosion allowances
- Steam jackets
- Special connection locations
- Bag hold down assembly (standard on QII design)
- Inner baskets for dual-stage straining or filtering
- Cleanable wire mesh lined or perforated strainer baskets
- Special alloy materials
- Hydraulic cover lifting assembly
- Sanitary fittings
- Differential pressure indicators

Certified to NSF/ANSI 61

Duplex Systems

All multi-basket models described here are also available as duplex systems. Two units come piped together with valves to permit continuous use of either unit while servicing the other. One lever actuates all valves simultaneously or it can be ordered for automatic service. See page 82.

Choose Housing Style

Designed to suit your requirements

The versatility of Rosedale Products provides a choice of several different designs.

- **Standard Housing Design (STD)** is durable and economic. It includes a davit arm and handwheel to facilitate cover removal. It is our most versatile housing design offering a variety of options, including our low profile design.

- **Spring Access Cover Design (HLP)** opens and closes without effort. Simply loosen the swing bolts and lift the cover up to open. An automatic cover stop is provided. See page 46 for details.

- **Quick Access Cover (QII)** features a unique counter weight design that makes opening, closing, and change-out, fast, easy, and simple. This will significantly reduce change-out time and lower operating costs. The QAC is rated to 150 PSI and constructed to meet ASME code requirements. Built-in safety features ensure that the cover cannot be opened unless the internal pressure is first released. The QII is offered with our low profile design making bags more accessible and easy to remove.

- **Low Profile Design (SLP) Housings** are compact and space saving, allowing for ease of bag change-out. Standard operating height is reduced, resulting in a safe design by eliminating platforms and ladders. The SLP is manufactured in any housing version, including our standard davit arm cover, QAC design, and spring assisted hinged cover.

Choose Baskets That Strain or Filter

Whatever your needs dictate

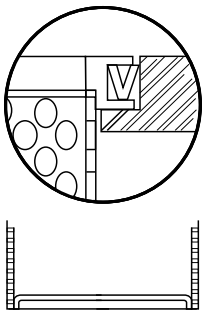
Strainer baskets are cleanable, reusable.

A seal is supplied on any strainer basket. It forms a seal between basket and housing to prevent dirty fluid bypass. Choose between various perforation sizes or wire mesh. Strainer baskets have flat, non-perforated bottoms and contain heavy-duty handles.

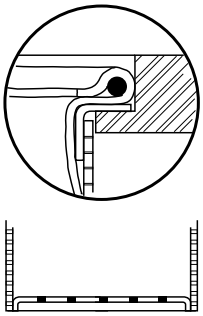
Filter bag baskets hold disposable filter bags.

Filter bags have an interference fit between the bags top rim and the housing causing a positive seal to prevent fluid bypass. Filter bag baskets have flat perforated bottoms.

Filter bags are available in a wide variety of felt, micro-fiber, monofilament and multifilament mesh materials. They are detailed completely on pages 150.



Model 24 with Strainer Baskets



Model 24 shown with PL Series Cartridge

DUAL-STAGE– Dual-stage action will increase strainer or filter life and reduce servicing needs. This straining/filtering action can be achieved by ordering a second, inner basket. It is supported on the top flange of the outer basket. Both baskets can be utilized as strainers (with or without wire mesh linings), filter bag baskets, or a combination of strainer and bag basket.

Basket Data

Surface area of each 30 in. basket: 4.4 sq. ft.

Volume of each 30 in. basket: 0.6 cu. ft.

Basket Construction

For cleanable strainer baskets, choose from the following perforation diameters: 1/4, 3/16, 9/64, 3/32, or 1/16 inch (for other not shown consult factory).

Any perforated basket can also be ordered lined with wire mesh. Stainless steel wire is used in mesh sizes 20, 30, 40, 50, 60, 70, 80, 100, 150, or 200.

Filter bag baskets, have standard 9/64 inch diameter perforations that are 51% open area. A wire mesh can also be utilized with bag baskets for two advantages:

1. Fiber migration is minimized.
2. In the unlikely event of bag rupture, the wire mesh better contains the contaminant.

QII **Low Profile**

Model Selection (For all housings)

Model No.	Number of Baskets	Straining, Filtering Area, ft2	Nominal Flow Rate (gpm)**	Inlet/ Outlet Size (in)
16	2	8.8	200	2,3,4*
18	3	13.2	300	2,3,4*
22	4	17.6	400	2,3,4,6*
24	6	26.4	600	2,3,4,6*
30	8	35.2	800	2,3,4,6,8*
36	12	52.8	1200	2,3,4,6,8,10*
42	17	74.8	1700	2,3,4,6,8,10,12*
48	23	101.2	2300	2,3,4,6,8,10,12*

* Not available on SLP, HLP, and QII styles.

** Nominal flow rate is based on water @ 1 psi ΔP. A lower fluid velocity is best for optimum filtering effectiveness (under 10 ft/sec is recommended).

Pressure Drop Data

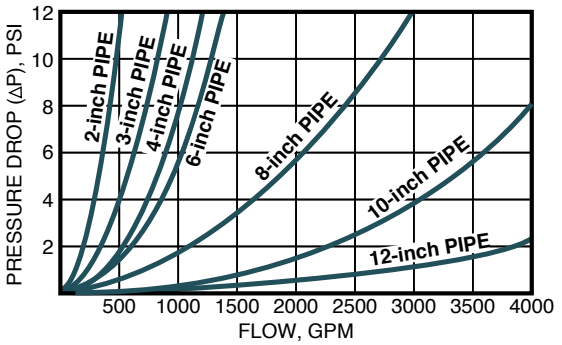
Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi, when they are clean. Higher pressure drops may be tolerated when contaminant loading is low.

Determining housing pressure drop:

The pressure drops shown on the graph are reliable for all multi-basket housings, including strainer baskets or bag filter (perforated only or mesh lined). The pressure drop of any housing is governed by the size of the inlet and outlet, not the vessel itself.

1. Using the desired pipe size and approximate flow rate, determine the basic pressure drop from the graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table.
3. You now have the pressure drop for a clean multi-basket unit. If bag filters are employed, you must add the pressure drop they incur to get a true pressure drop for the assembly.

Note: Filter bags are specified separately.
See page 150.



Recommended flow rates are based on housing only. Fluid viscosity, filter bag used, and expected dirt load should be considered when sizing a filter.

Viscosity Factors

CPS NUMBER								
1 (H_2O)	50	100	200	400	600	800	1000	2000
.65	.85	1.00	1.10	1.20	1.40	1.50	1.60	1.80

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. Other styles and classes available. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.

***Note: Because of its unique Quick Access Cover, the Q (QII) housing style is available only with a Viton cover seal.**

HLP Series Multi-Basket Strainers and Multi-Bag Filters with Spring-Access Cover

These multi-basket strainers and bag filters offer a wide range of flow capacities and contaminant-holding capabilities. They contain from 2 to 23 baskets/bags. Larger units that hold more baskets/bags are available, consult Rosedale.

- Low Profile Design Housings are compact and space saving, allowing for ease of bag change-out. Standard operating height is reduced, eliminating platforms and ladders.

- Spring Assisted Hinged Cover opens and closes without effort. Simply loosen the swing bolts and lift the cover up to open. An automatic cover stop is provided.

- The units meet ASME code requirements for 150 PSI ratings. Rosedale is an ISO 9000 facility.

NSF

Certified to NSF/ANSI 61

Features

- Permanently piped housings are opened without disturbing the piping
- Machined cover seal groove provides positive sealing
- Carbon steel, 304 or 316 stainless steel construction housings (wetted parts)
- Large-area, 30-inch deep, heavy-duty, 9/64-inch perforated baskets
- Easy to clean
- Low pressure drop
- Three cover seal materials: Buna N, Ethylene Propylene, and Viton®
- Pressure rating 150 psi
- Flanged connections for 2 through 8-inch pipe
- Vent, drain and gage connections
- Bag hold down assembly

Options

- ASME code stamp
- Special connection locations
- Inner baskets for dual-stage straining or filtering
- Cleanable wire mesh lined or perforated strainer baskets
- Special alloy materials
- Sanitary fittings
- Bag or cartridge design
- Differential pressure indicators
- Safety pressure release
- Steam jackets (body jacket only)

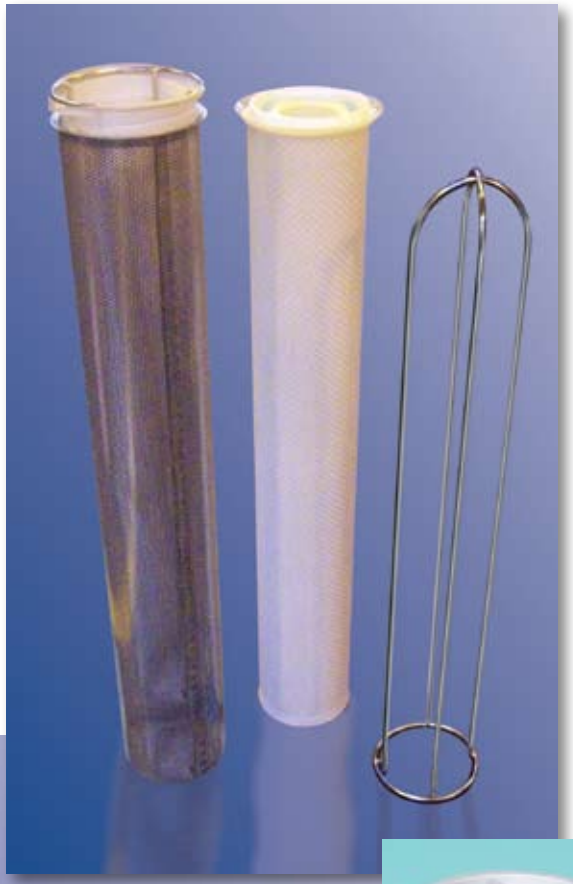
Rosedale High Flow Filtration Systems

- From 1 to 31 elements per filter housing
- Beta 5000 (99.98% efficiency) rated for consistent product quality
- Operator-friendly cartridge and housing system
- High flow performance in a convenient design
- Horizontal mounting configuration



DPU Series Cartridge

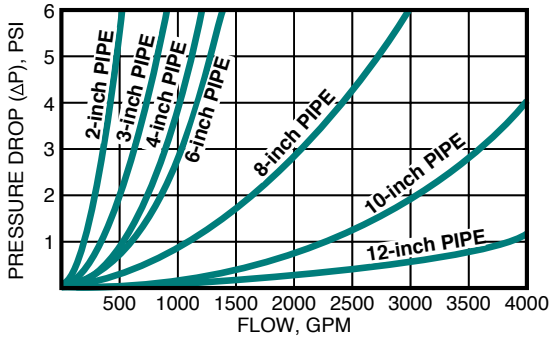
Model 18340

High Flow Housings

These housings are available in standard and custom configurations to suit your specific needs. All housings are designed, manufactured, tested, and code stamped in accordance with ASME Section VIII, Division 1.

They are available in a variety of sizes to accommodate from 1 to 31 filter cartridges in 40-inch and 60-inch lengths and two popular styles. You can select from the "High Flow" basic size 6.32-inch (152.4 mm) seal diameter or "Trade Size" #2, 7.20-inch (182.9 mm).

Larger housings are available upon request. The horizontal style maximizes ease of operation and change-out, while reducing the systems footprint.



Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

Features

Horizontal mounting configuration

Hinged cover for easy element change-outs

Standard pressure / temperature ratings to 300 psig and 250 ºF

Available in Carbon Steel, 304, or 316 Stainless Steel

40" and 60" element lengths

Rosedale Model HSS300 and HSS750

Single Cartridge Housings for Liquids

The Rosedale Model HSS single element filter housing is an all stainless steel unit ideal for general industrial service. It features a ring-nut closure (HSS 300) or bolt closure (HSS750) for easy access to the head and cartridge sump.

- The HSS is available in 10", 20", 30", or 40" cartridge models.
- HSS300 units are rated for 300 PSI service at 200°F.
- HSS750 units are rated for 750 PSI service at 200°F.

Flow rates to 40 GPM are acceptable depending on cartridge selection. Buna-N gaskets are standard, while other materials are available.

Standard Features

- Simple closure for quick cartridge change outs
- In line fittings for easy installation
- Knife edge seal at both cartridge ends to eliminate by-pass
- Housings accept double-open-end cartridges

MODEL HSS300

Model 7180 Series Hydraulic Lube-Oil Filter

Designed for use with 718 and 736 style filter cartridges. Flows to 100 GPM.

The 7180 series Hydraulic lube filters are ideal for your oil reclamation and maintenance operations.

The 7180 series housings incorporate an eyenut cover that is easily removed, reducing time spent on cartridge change-out. The side-in/side-out piping arrangement is available in 1", 1-1/2", and 2" NPT connection sizes. Housings are electropolished creating a smooth, easy-to-clean surface.

The 7180 series accepts single 718 or 736 style filter cartridges, and are rated at 1µ absolute to 100µ nominal. They seal on the housing's elevated pedestal and are retained by a threaded post and cap assembly.

Keep your filtration process cost effective without sacrificing quality.

MODEL 8-7182

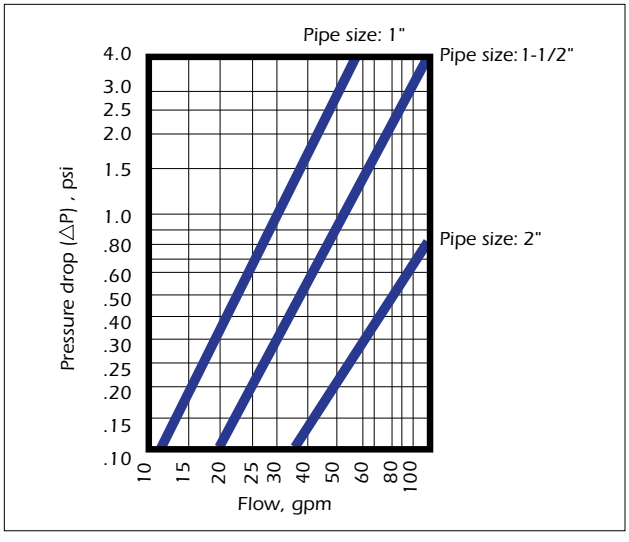
DUPLEX MODEL D8-7182

Applications

- Bulk Oil Handling
- Coolants
- Cutting Oils
- Fuels
- Hydraulic Oils
- Lubrication Oils
- Process Liquids
- Quench Oils
- Rolling Mill Oils
- Solvents

Features

- Permanently piped housings are opened without special tools
- Carbon steel housings or 304 and 316 stainless steel
- Covers are O-ring sealed
- 150 psi rated housing
- 1", 1-1/2", or 2" NPT inlet and outlet
- 1/4" NPT vent connection



*Based on housing only. Fluid viscosity, filter bag used, and expected dirt loading should be considered when sizing a filter.

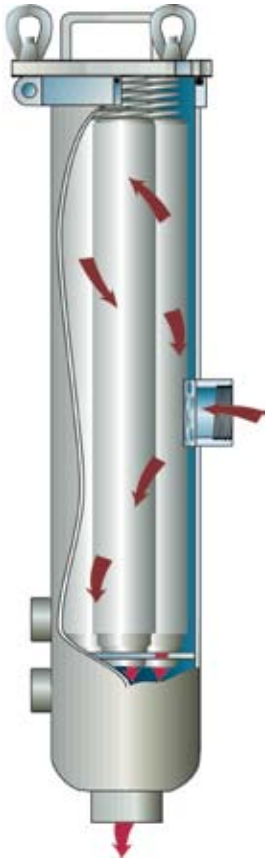
Cartridge Filter Housings

These cartridge filters offer a wide range of flow capacities and contaminant holding capabilities. The housings can accommodate from 1 to 205 cartridges around. All housings can be supplied with an ASME code stamp, if required.

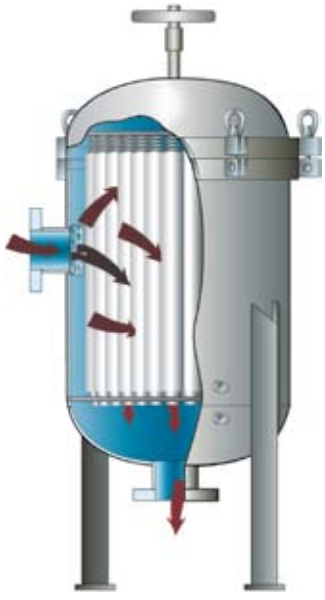
Standard Features

- Low pressure drop
- Permanently piped housings are opened without special tools and without disturbing the piping
- Machined cover gasket groove provides positive O-ring sealing
- Easy to clean
- In-line inlet and outlet
- Stainless steel internals



Standard Options

- 2 outlet styles
- Carbon steel, 304 or 316 stainless steel housings
- ASME code stamp
- O-ring seals: Buna N, EPR, Viton®, Teflon®
- Accommodates 10, 20, 30 or 40-inch cartridges
- Flanged connections for 3/4 through 12-inch pipe
- V posts or threaded center posts
- Units accept DOE or 222 style cartridges



Center: Models 4, 6 and 8
Bottom Right: Models 12 thru 48

How They Work

Unfiltered fluid enters the housing and is distributed evenly around the cartridges, from outside to inside. Solids are collected on the outside for easy removal. The filtered fluid then exits through the outlet pipe.

Cartridge Requirements

The following table gives the number of cartridges needed for each housing model.

Model Number and Diameter	Cartridge Lengths	Number of Cartridges	Equivalent 10-inch lengths	Available Pipe Sizes
Model 4	10-inch	1	1	3/4, 1, 1-1/4, 1-1/2, 2
	20-inch	1	2	
	30-inch	1	3	
	40-inch	1	4

Determining Housing Pressure Drop Only

The pressure drops shown on the graph are reliable for all cartridge housings. The pressure drop of any housing is governed by the size of the inlet and outlet, not the vessel itself.

1. Using desired pipe size and approximate flow rate, determine the basic pressure drop from the graph.

2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table.

3. You now have the pressure drop for an empty cartridge housing.

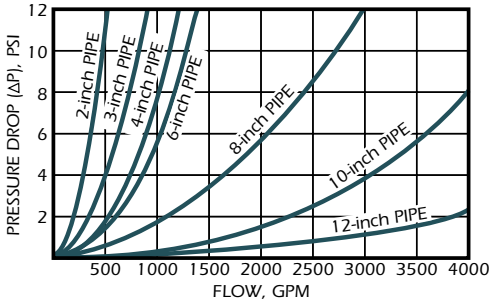
4. The user selected cartridge pressure drop must then be added to the housing pressure.

5. To calculate pressure drop through cartridges, see page 192.

Viscosity Factors

CPS NUMBER

1 (H_2O)	50	100	200	400	600	800	1000	2000
.65	.85	1.00	1.10	1.20	1.40	1.50	1.60	1.80



*Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

ASME CODE STAMP
C = Code

CARTRIDGE SEALING METHOD
VP = V Post and Spring Seal
TP = Threaded Post
For other styles, consult factory

CARTRIDGE DESIGN[4]
DOE = Double-Open End
SOE = Single-Open End
222 = Double O-Ring
226 = Bayonet Lock (Pall)

COVER SEAL
B = Buna N
E = Ethylene Propylene
V = Viton®
TEV = Teflon® Encapsulated Viton®
TSW = Teflon® (solid white)

HOUSING MATERIAL[2]
C = Carbon Steel
S = 304 Stainless Steel
S316 = 316 Stainless Steel

PRESSURE RATING[3]
150 =150 psi (NPT or flanged)
300 =300 psi (NPT or flanged)

PIPING STYLE[2]
1 = Side Inlet, Bottom Outlet
2 = In-line, Inlet-high, Outlet-low

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. Other styles and classes are available. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Consult factory for special options.
3. Higher pressure ratings available. Consult factory.
4. Filter cartridges are sold separately. See page 150.

Pressure Drop Data

Cartridge filters are usually selected so that the clean pressure drop does not exceed 2 psi. Higher pressure drops may be tolerated when contaminant loading is low. The user must determine the appropriate cartridge for the application, and note the flow rate ΔP per cartridge as suggested by the media manufacturer.

Viscosity Factors

CPS NUMBER								
1 (H_2O)	50	100	200	400	600	800	1000	2000
.65	.85	1.00	1.10	1.20	1.40	1.50	1.60	1.80

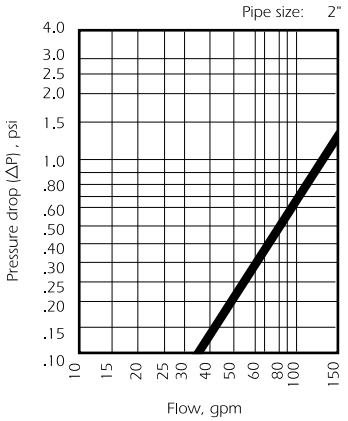
Cartridge Filters

*Rugged, low-cost cartridge design for flow rates to 100 gpm**

These cartridge-filter housings are rugged and low in cost. They hold five cartridges, in 10-inch, 20-inch, 30-inch, or 40-inch lengths, using industry standard designs (222, SOE, or DOE). The unique, "quick-opening" clamp design uses a standard O-ring.

Standard Features

- Low pressure drop
- Permanently piped housings are opened without disturbing the piping or requiring tools
- Quick-opening, clamp-type cover
- Carbon or stainless steel housings
- Adjustable-height tripod legs
- Holds 5 cartridge elements
- Accommodates cartridge elements in four lengths: 10", 20", 30", 40"
- 125-psi rated housing
- 3/4-inch clean-dirty/gage ports
- 2-inch female NPT ports
- V posts or threaded-center posts
- Standard hardware V-post and spring seals are 316 stainless steel.
- O-ring seals: Buna N, EPR, Viton®



*Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

How To Order

Reduced Pressure Model 8 Cartridge Housing

Build an ordering code as shown in the example

Platinum 700 Cartridge Filter Housings

Ultra high capacity filter eliminates maintenance by providing high dirt removal

These new cartridge housings are designed to end the high cost of cartridge change-out. They are offered in three Model 8 styles (LCO, Polypropylene, and Standard Model 8) and Multi-cartridge housings.

Standard Features

- From 1 to 29 cartridges
- Multi-cartridge units are offered in the low profile design, for quick and easy cartridge removal
- Horizontal or vertical mount
- Housings available in carbon steel, 304 or 316 stainless steel and polypropylene
- Pressure ratings in 100, 125, and 150 psi
- ASME code stamp available on selected models
- Flanged or threaded connection sizes from 2-inch through 10-inch
- Covers are o-ring sealed and easy to remove
- Leg assembly (excludes CR8)
- Clean and dirty/gage port connections
- O-ring seals: Buna, Ethylene Propylene, Viton®, and Teflon® Encapsulated Viton®

NSF

Certified to NSF/ANSI 61

A single 700 Series cartridge unit will out perform 40 standard wound or 10 pleated cartridges, reducing maintenance. A decrease in cartridge use, reduces labor, inventory, worker exposure and disposal costs. A single cartridge holds as much as 20 pounds of contaminant and flows to 100 gallons per minute. The labor-intensive v-posts and spring seals are eliminated and cartridges are easily removed, requiring no special tools. Elements are approximately 6.25-inch diameter and 35-inch length.

The Platinum 900 and 2040 Cartridge Filter Housings

Ultra high capacity filtration system provides maximum dirt holding capacity–eliminating maintenance

End the high cost of element change-out with the Platinum 900 and 2040 cartridge filter system. Imagine changing a filter element only once or twice a year, instead of changing several cartridges on a weekly or daily basis!

Standard Features

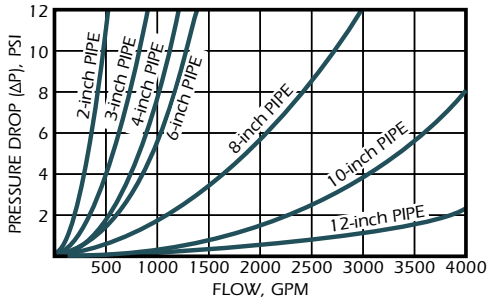
- Housings available in carbon steel, 304 or 316 stainless steel.
- Pressure rating 150 psi
- Clean and dirty/gauge port connections
- O-ring seals: Buna, Ethylene Propylene and Viton®
- Covers are o-ring sealed and easy to remove
- ASME code stamp (optional)
- Flange connection sizes from 3-inch through 10-inch
- Cable-hoist assembly for quick and easy removal of element is standard on Model 18 (optional on other models)

A single cartridge system has the life of hundreds of standard wound or 50 pleated cartridges. This reduces maintenance and cartridge use, labor, inventory, worker exposure, and disposal costs.
Flow rates and contaminant holding capacities vary depending on micron size. A single cartridge element can hold up to 400 pounds of contaminant and flows to 600 gallons per minute. Elements are 13- or 20-inch diameter and 40-inches long.

The 900 Series filter housings contain one, three, four, seven, or eight cartridges. The 2040 Series is available a single cartridge.

By using the cable-hoist assembly change-out is completed in minutes. The element shipping container allows for easy handling and disposal.

Extra large cartridges hold more contaminate.



* Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

Rosedale Fabricated Basket Strainers

Standard or Custom Design

Rosedale Fabricated Strainers are available in standard designs as shown, or can be custom designed and manufactured to fit your specific requirements. The standard strainer is designed and built in accordance with ASME Code Section VIII, Division 1. Available code designs include ANSI B 31.4, ANSI B 31.3, and ANSI B 31.8. Standard housing material is carbon steel, 304 stainless steel, or 316 stainless steel.

Rosedale Fabricated Strainers can be supplied in ANSI flange ratings. We have the design capabilities and manufacturing facilities to handle your straining requirements to 50 microns. Rosedale Fabricated Strainers are available in pipe sizes from 2" to 24".

For assistance designing a strainer to fit your application, please contact us.

S = 304 Stainless steel
S316 = 316 Stainless steel

Legs are Optional depending on size of unit and application.

Basket Removal Cable Hoist is available as an option.

Please consult factory.

Model BS with basket removal cable hoist assembly.

Duplex Bag Filters And Basket Strainers

Trouble free, continuous operation

Duplex filters permit continuous operation, reducing overall operating costs. Flow can be switched back and forth between two filter vessels, allowing one side to be serviced while the other is in use.

The Rosedale duplex, using a single multi-ported valve operating system, is a better solution, and offers many benefits:

- Four separate valves are used all operated simultaneously by a single lever.
- Valves use the standard butterfly design, known for their effective seal, low pressure drop, and low cost.
- Any of the valves can be serviced individually, without need to disturb the other valves or piping. Replacements are readily available.
- Valves are soft-seated to provide bubble-tight closure.
- A variety of valve seal materials is available for use with a number of hard-to-handle fluids.
- Pressure drop is minimized because the flow path has the equivalent of only four elbows instead of the usual six.
- Mechanical stops assure that the valves are completely open or closed.
- A single-valve pressure balancing vent system is furnished to ease movement of the lever and to fill the just serviced vessel before use.
- Vents in filter covers and drain ports in filter housing speed evacuation and filling.
- Remotely operated power actuators and automatic power actuation (triggered by pressure differential sensing) are offered. Air or electric actuation is best if such power is available.

Construction Materials

Available in carbon steel, 304 stainless steel, or 316 stainless steel.

Internal valve parts other than seals are 316 stainless steel.

Four different materials can be ordered for all seals involved.

All baskets and mesh linings are made of stainless steel. 304 stainless will be supplied with carbon and 304 housings, 316 stainless with 316 housings.

Choosing a Basket Strainer or Bag Filter

Choose between straining a fluid (removing particles down to 74 micron size) and filtering it (removing particles down to 1 micron).

Pressure Drop Data

Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi, when they are clean. Higher pressure drops may be tolerated, when contaminant loading is low.

The pressure drop data are accurate for all housings with strainer or filter bag baskets. When filter bags are added, total pressure drop becomes the sum of the pressure drop as determined by the steps below plus the pressure drop through the bag as defined on pages 80-81.

Follow these easy steps:

1. Using the desired pipe size and approximate flow rate, determine the basic pressure drop from the appropriate graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table. This is the adjusted (clean) pressure drop for all baskets without filter bags.

Note: Filter bags are specified separately. See page 150.

	Viscosity, cps								
	1 (H_2O)	50	100	200	400	600	800	1000	2000
All unlined baskets	.65	.85	1.00	1.10	1.20	1.40	1.50	1.60	1.80
40-mesh lined	.73	.95	1.20	1.40	1.50	1.80	1.90	2.00	2.30
60-mesh lined	.77	1.00	1.30	1.60	1.70	2.10	2.20	2.30	2.80
80-mesh lined	.93	1.20	1.50	1.90	2.10	2.40	2.60	2.80	3.50
100-mesh lined	1.00	1.30	1.60	2.20	2.40	2.70	3.00	3.30	4.40
200-mesh lined	1.30	1.70	2.10	3.00	3.40	3.80	4.40	5.00	6.80

Selecting A Size

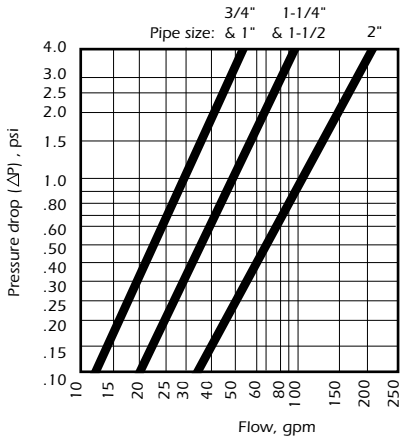
These descriptions and flow charts can aid in size selection. Capacities given are for each of the two vessels in any duplex system.

Model 4–For flow rates to 50 gpm*

- Pipe sizes 1, 2, or 3 inch, flanged
- Basket depth: 12 inches (nominal)

Basket Data

Depth (nominal, inches)	Diameter (inches)	Surface Area	Volume (cu. in.)
12	3.9	1.0	130

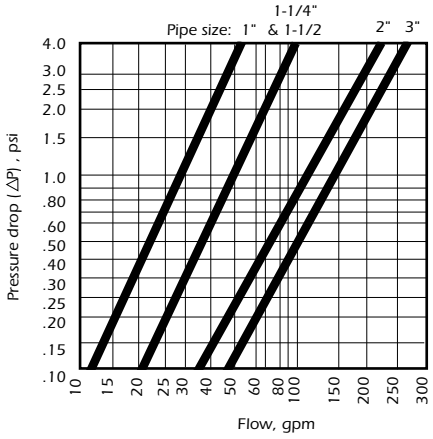


Model 6–For flow rates to 100 gpm*

- Delivers 3.4 square feet of basket or bag surface without need for ASME code construction.
- Can be fitted to hold cartridge filter elements
- Pipe sizes 1, 2, 3, or 4 inches (flanged).
- Two basket depths: 18, or 30 inches (nominal)

Basket Data

Depth (nominal, inches)	Diameter (inches)	Surface Area	Volume (cu. in.)
18	5	2.0	350
30	5	3.4	630

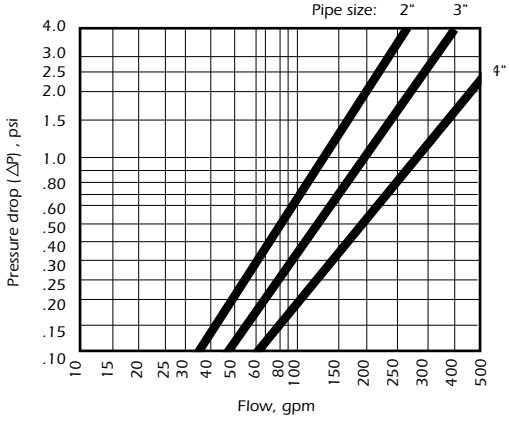


Model 8–For flow rates to 220 gpm*

- Can be fitted to hold cartridge filter elements
- Pipe sizes 2, 3, or 4 inch, flanged.
- Two basket depths: 15 or 30 inches (nominal)

Basket Data

Depth (nominal, inches)	Diameter (inches)	Surface Area	Volume (cu. in.)
15	6.7	2.3	500
30	6.7	4.4	1000



*Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

Single-Basket Models (IN)

Model	Flange Size	A				B	B1 (Model 82 only)	C	D	F	G	H	I	J (Model 82 only)

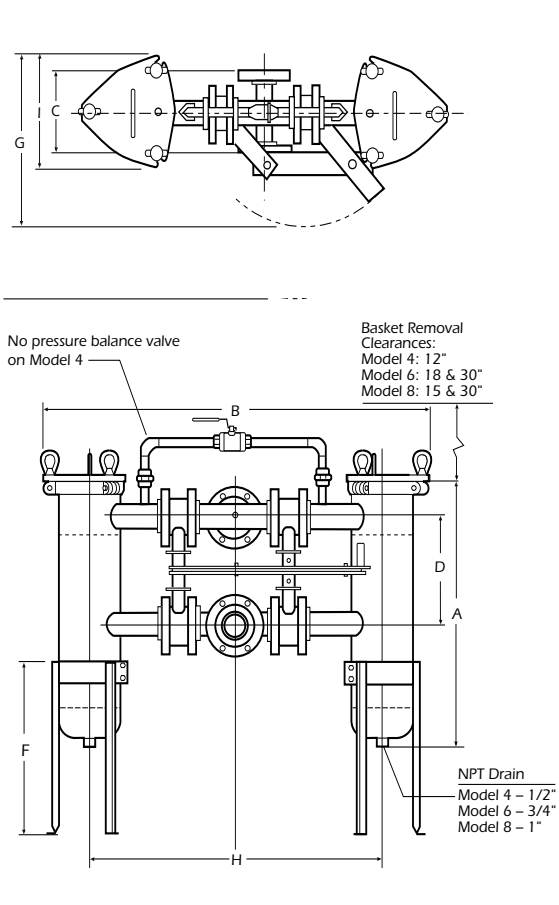
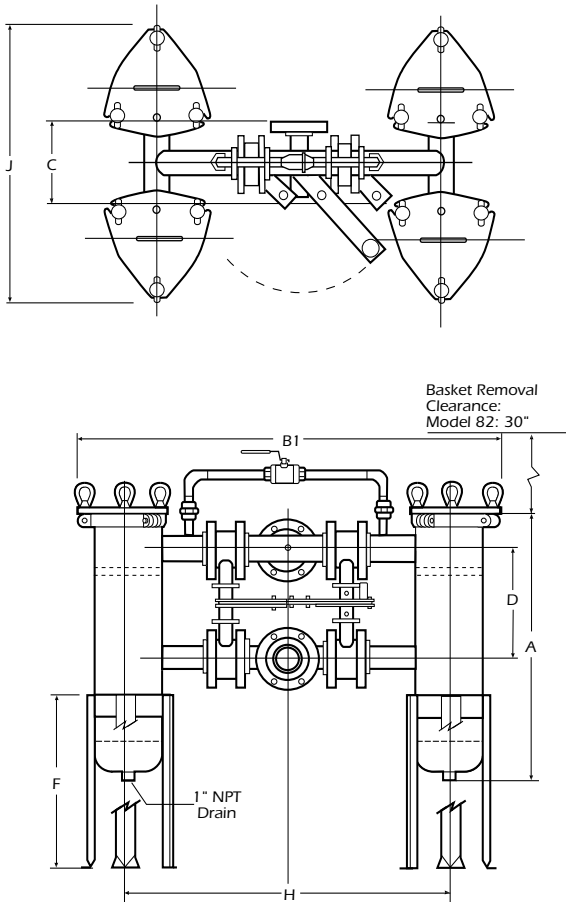
The inlets and outlets on all duplex systems come standard in a horizontal configuration (facing opposite directions). The option of arranging the inlet and outlet is available in three positions, 90° apart. The system is designed with flanged tees, allowing the orientation to be changed in the field.



Duplex Models 4, 6, and 8



Duplex Model 82

Duplex Bag Filters With Automatic Sequencing

Continuous, uninterrupted operation is provided by these automatic duplex filters

When the filter bags on one side get to the point of requiring change-out, the incoming flow is automatically diverted to the clean filter bags on the other side. Maintenance personnel are alerted to the need to change the dirty filters so that the system will be ready for the next cycle.

Typical step-by-step operation

1. As the filter bags in vessel A become so loaded with particulate that the differential pressure increases to a selected level, a switch actuates an air-operated valve in the loop pipe. This diverts a small flow of fluid to fill vessel B. After enough time to equalize the pressure in the two vessels, the four main valves are actuated by an air cylinder.

2. The duplex valve system shifts four valves at once, closing the inlet and outlet on vessel A and opening the two on vessel B.

   An indicator light (and remote signal, if desired) shows that vessel B is now being utilized. Another light shows that the shift from one vessel to the other has occurred, and that filter bags need to be replaced, An electrical interlock prevents another shift cycle until the dirty filter bags have been replaced and the operator has pushed a reset button.

3. With the interlock released, the system is ready to cycle whenever the pressure differential again indicates the necessity.

Availability

The automatic duplex valve system can be ordered on any Rosedale filter vessel. The standard multi-bag filter models are shown in the table.

The main inlet and outlet connections can be positioned to accommodate any flow direction within reason.

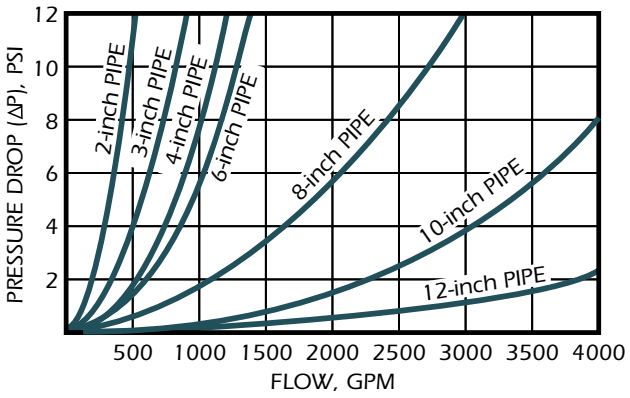
Systems are shipped assembled, ready for use, often on dollies or skids to assist putting them in place.

Rosedale Model No.*	Number of bags	Nominal flow rate, gpm
16	2	400
18	3	600
22	4	800
24	6	1200
30	8	1600
36	12	2000
42	17	3500
48	23	4500

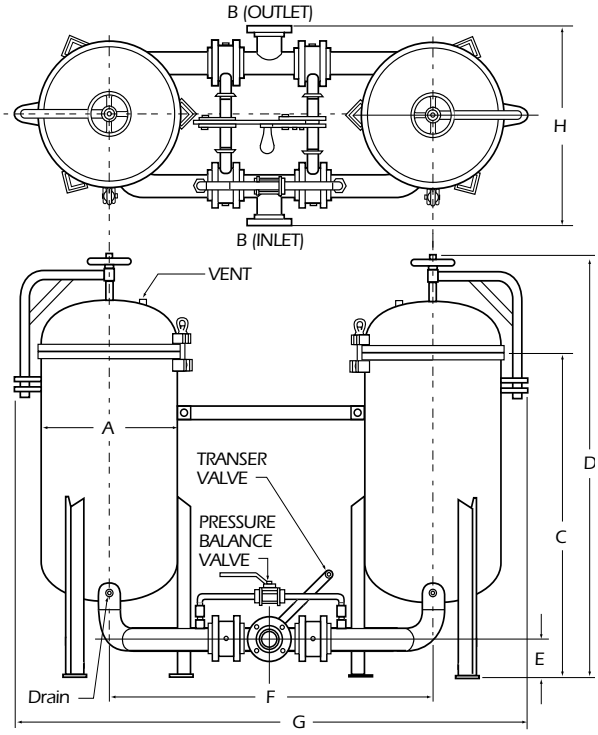
* Model number also indicates vessel diameter in inches.

Models 16 through 48 – For flow rates to 4600 gpm

- Contain from 2 to 23 baskets
- Pipe sizes 2 through 12 inches, flanged
- Two basket depths: 15 or 30 inches (nominal) both 6.7 inches in diameter



Multi-Basket Models (IN)



The inlets and outlets on all duplex systems come standard in a horizontal configuration (facing opposite directions). The option of arranging the inlet and outlet is available in three positions, 90° apart. The system is designed with flanged tees, allowing the orientation to be changed in the field.

Model Number	Number of Baskets	Basket Depth (nom.)	Surface Area (sq. ft.)	Flow Rate* (gpm)
16	2	30	8.8	400
18	3	30	13.2	600
22	4	30	17.6	800
24	6	30	26.4	1200
30	8	30	35.2	1600
36	12	30	52.8	2400
42	17	30	74.8	3400
48	23	30	101.2	4600

*Based on housing only. Fluid viscosity, filter cartridge used, and expected dirt loading should be considered when sizing a filter.

EE = Electric controller/Electric actuators
PP = Pneumatic controller/Pneumatic actuators
JB = Junction Box

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME housings.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are ordered separately. See page 150.

Automatic Backwashing Filtration System

There are many advantages to our Automatic Backwashing Systems.

- Reduces process/system downtime
- Reduces operator exposure
- Reduces maintenance cost
- Reduces waste fluid
- Reduces filter element disposal and replacement cost
- Increases productivity

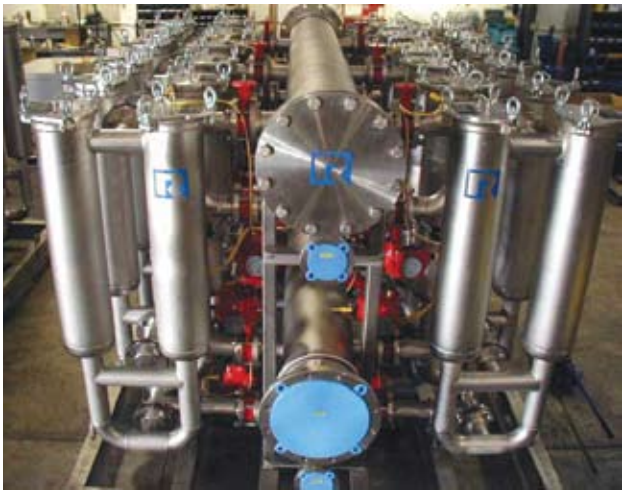
Self-cleaning filters represent the ideal situation and provide the most productive and labor free solution. Rosedale Products' ABW is unique because our patented technology backwashes with the lowest volume of liquid. This is achieved by using air to create the shear velocity needed to effectively clean the filter with the clean liquid inside each housing chamber.

Flexible and Versatile

Flow rates to several thousand GPM can be easily accommodated. To meet space requirements various configurations are available. Micron ratings from 2 microns are possible in sintered porous metal, wedge wire, and nylon filter bags. Continuous flow is maintained by taking one station off line while the rest continue operating.

Single vs Dual Stations

On systems with flow rates less than 400 GPM our standard is "single station" systems which means each housing is a station. Larger systems use a "dual station" approach which has two housings per station. The two housings share a common manifold which allows a reduction in valves and, during backwash, two housings at a time (1 Dual Station) go off-line for cleaning.



Applications

The ABW is being used in many industries throughout the USA as well as overseas in such places as Argentina, Taiwan, Chile and Venezuela.

Industries served include: Automotive - Steel - Petroleum - Chemical - Pharmaceutical - Electronics - Nuclear Power - Superfund Sites - Groundwater & Soil Remediation - Commercial Laundries - Entertainment - Food - Mining -Detergents - Paper

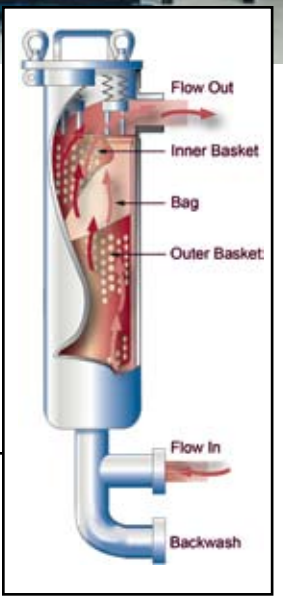
Applications include: Cooling Towers - Coolants - Membrane Protection - Sulfuric and other Acids -Harvesting Steroids - Oil Reclamation - Potable & DI Water - Bottling Plants - Food Processing - Recycling - Decorative Ponds

Turnkey Systems

Our systems have included air compressors, pumps, power distribution boxes, motor starters, climate controlled enclosures, heat trace and air dryers, all skid mounted and ready for installation.

How It Works

Fluid is introduced through the bottom of the filter housing. It is then forced through a filter element where the contaminant is captured on the outside surface of the filter. The clean fluid exits through the outlet. A controller monitors the differential pressure across the filter. When enough contaminant collects on the element and the differential pressure reaches a pre-selected point (^P), the backwash sequence is initiated. The backwash is accomplished by automatically shocking the filter with air and forcing the dirty fluid through the waste outlet. There is no introduction of additional fluids to contaminate the process, and the volume of liquid discharged is held to a minimum, reducing disposal costs. When the backwash operation is completed, the system returns on-line, the controller resets itself, and the whole process begins again.



Media Characteristics

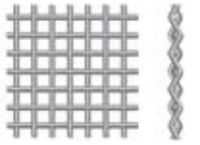
This information is intended to be used as a general guideline. Since some characteristics are very similar from one media to the next, you should choose the media whose advantages best fit your particular filtration requirements. Consult Rosedale for assistance in selecting the proper media for your application.

Wedge Wire (WW) or slotted, is the most durable of all backwashable media. They are strictly limited to .001" slot or 25 micron as the lowest retention rating. Wedge wire is particularly suited for critical low maintenance applications. As a result of their construction, they are used in many instances where manual cleaning is necessary but might damage other types of media.

MICRON RATING	OPENING (INCH)	% OF OPEN AREA
25	.001	2.1
50	.002	4.2
75	.003	6.1
150	.006	11.5
250	.010	18.0
350	.014	23.0

Poroplate® filter media is made from layers of stainless steel wire cloth diffusion-bonded together to form a rigid porous metal laminate structure. Poroplate filter media is corrosion resistant, cleanable, and can withstand high temperature applications up to 800°F. Micron ratings from 2 to 150 are available.

MICRON RATING	NOMINAL RATING	ABSOLUTE RATING
10	2µ	10µ
25	10µ	20µ
50	20µ	40µ
75	40µ	70µ
100	100µ	100µ
150	150µ	150µ



Nylon monofiliment provides exceptional backwash efficiency. It exhibits a wide range of retention ratings. Nylon media should be considered for the filtration ranges of 25-75 microns. Filter bags have a defined cycle life.

MICRON RATING	% OF OPEN AREA
75	43
50	36
25	33

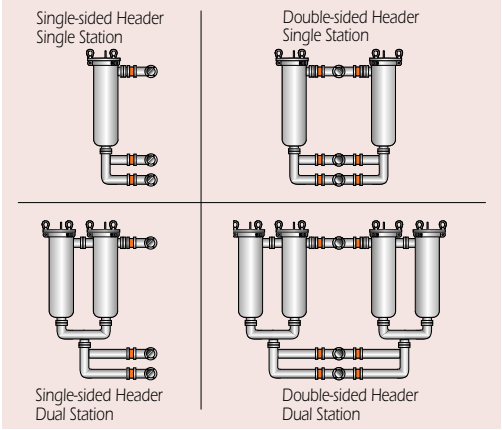
D = Double sided

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME housings.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are ordered separately. See page 150.



Stations and Headers

Rosedale offers both single and double-sided headers to conform to space restrictions. Header pipes have connections on one or on both sides. Each housing is separately controlled, increasing capacity while maintaining a high-level of control. A station has one set of controls, while accepting either one filter housing per station (a single station), or two housings per station (a dual station). Capacity is again increased, but the number of controls are minimized. By minimizing those controls, great savings are realized. For example, everything else being equal, a single-sided header with three dual-stations accommodates the same six housings and flow as a double-sided header with six single-single stations. However, there are three less controls on the dual-station unit, greatly reducing costs, perhaps as much as $15,000.

Multiplex Filters and Strainers From Rosedale Products

These high-capacity filters and strainers require no flow interruption for servicing

- For use with filter bags for filtering to as fine as one micron, or with perforated strainer baskets
- From 2 to 10 Model 8 housings are mounted in parallel to inlet and outlet manifolds
- Each unit has inlet and outlet valves, gage ports, and a drain port, to permit servicing one at a time
- These are completely packaged free-standing systems in carbon steel and stainless steel

See page 12 for more details on the Model 8 housings used.

How To Order

Build an ordering code as shown in the example

Example: M8-30-10 - 8F - 4 -150 - C - B - S - M - 200 -D- C - 2M-50

(Housing: M8-30-10 - 8F - 4 -150 - C | Options: B - S - M - 200 -D- C | Optional Inner Basket: - 2M-50)

MODEL NO.

Multiplex = **M8-30**

NUMBER OF HOUSINGS

2, 3, 4, 5, 6, 7, 8, 9, 10

PIPE SIZE (FLANGED)

3-in = **3F**
4-in. = **4F**
6-in = **6F**
8-in. = **8F**

VALVE TYPE & SIZE (INCH)

Butterfly type = **2, 3, 4**

PRESSURE RATING

150 psi = **150**

HOUSING MATERIAL

Carbon steel = **C**
304 stainless steel = **S**
316 stainless steel = **S316**

COVER SEAL

Buna N = **B**
Ethylene Propylene = **E**
Viton® = **V**
Teflon® Encapsulated Viton® = **TEV**
Teflon® (solid white) = **TSW**

BASKET SEAL

Seal required = **S**

OPTIONAL INNER BASKET

INNER BASKET, MEDIA SIZE

Perforation diameters (for type 2P baskets)
1/4, 3/16, 9/64, 3/32, 1/16
Mesh sizes (for type 2M and 2BM baskets)
20, 30, 40, 50, 60, 70, 80, 100, 150, 200

INNER BASKET, TYPE

No sym. = No inner basket
2P = Perforated strainer
2B = Filter bag*
2M = Mesh-lined strainer
2BM = Mesh-lined filter bag

ASME CODE STAMP

C = Code

DISPLACER

D = Displacer

OUTER BASKET, MEDIA SIZE

Perforation diameters (for type P baskets)
1/4, 3/16, 9/64, 3/32, 1/16
Mesh sizes (for type M and BM baskets)
20, 30, 40, 50, 60, 70, 80, 100, 150, 200

OUTER BASKET, TYPE

PB = Perforated strainer
B = Filter bag*
M = Mesh-lined strainer
BM = Mesh-lined filter bag

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME housings.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are ordered separately. See page 150.

Solids/Liquids Separators

In-Line Separators for Industrial Applications

Use our centrifugal-action separator to remove grit, sand, metal chips, fines, and other solids from liquids. Perfect for use as a pre-filter to extend the life of fine filtration systems. These units require little or no maintenance, as there are no moving parts to wear out, or filter media to replace. The unit only requires a simple purging, eliminating downtime. For flows from 6 gpm and retention ratings to 50 micron.

How it works:
Fluid enters the pressure vessel tangentially at high velocity. A centrifugal action is created, which forces the solids to separate and enter the sump, while the clean liquid exits up through the standpipe. The solids collect in the sump, and can easily be purged. The operation is so simple, it can be set to automatically purge on a timed interval.

Features

- Low constant pressure drops
- Piped housings
- Carbon steel or stainless steel (304 or 316) construction for housings
- All housings are electropolished to resist adhesion of dirt and scale
- ASME code stamp available
- Pipe sizes 3/8 through 10-inch (larger sizes also available)

Options

- Different outlet connections
- Special materials

Typical Applications

- Cooling towers
- Process water
- Food processing
- Chemical processing
- Well water
- Pulp & paper mills
- Mining operations
- Steel mills
- Petrochemical industry
- Power plants
- Protection of spray nozzles and other small orifices
- Chip removal from cutting coolants
- Car and vehicle wash systems
- Paint spray booths
- Heat exchangers
- Spray nozzle protection
- Industrial laundries
- Solids recovery
- Parts washing systems
- Pump protection
- Domestic Water
- Recirculating cooling water
- Sprinkler systems
- Quench water
- Pre-filter for seawater

FLOW RANGE – GPM

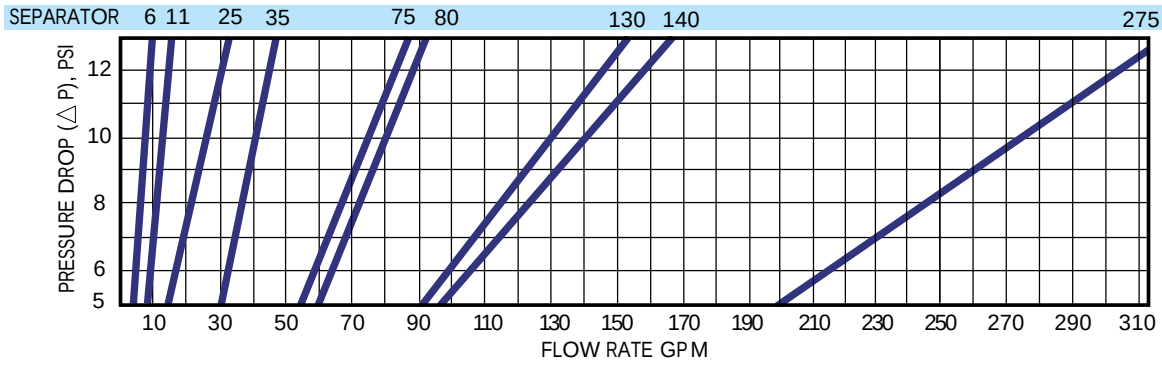
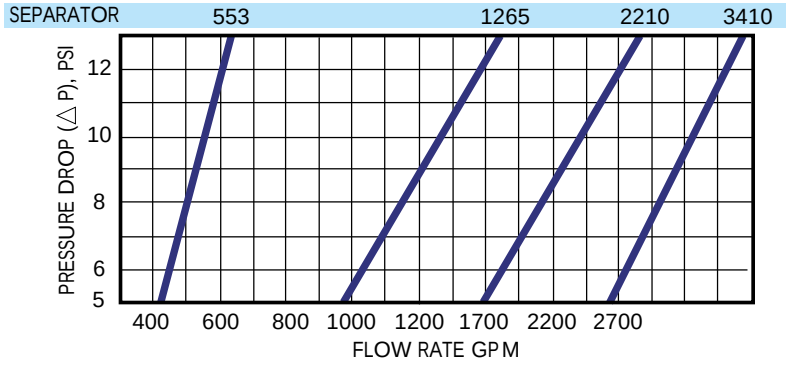
Glass (Crystal)	3.0	Steel	7.8
Granite/Gravel	2.5-3.0	Tin Ore	6.4-7.0





Separator Sizing:

Separators are generally sized so that there is at least a 5 PSID pressure drop across the unit. Separation efficiency increases as pressure drop increases. We've shown flow ranges for each unit based on 5 and 10 PSID. Choose a unit based on a flow/efficiency balance.

Installation

The Separator should be installed in a near vertical position. The unit should be supported by means other than the inlet/outlet piping. First, connect the outlet of the unit to the outlet piping. Then install any supports, such as U-bolts or legs. Next, connect the inlet piping to the inlet. Test for leaks and separation. The unit is now ready for operation.

Purging and Maintenance

Separators must be purged regularly. If they are not, the separated solids will accumulate and overflow the collection area, affecting performance and contaminating effluent.

You can manually, automatically, or continuously purge the collection area of the separator. Manual purging requires that the operator open a simple valve and empty the contents. Automatic purging can be done many different ways, but the simplest is setting a timer to open and close the valve, purging the contaminant on a regular basis. Continuous purging simply requires leaving a manual valve partially open at all time, letting the contaminant leak out at a controlled rate. For best results, all purging should be done while the separator is in operation. Avoid purging "uphill" which will result in buildup and clogging, affecting performance and operation.

Simple rules of maintenance include checking the purge valve regularly for clogging, scale, and buildup. If the unit is installed in an area where the ambient temperature is below freezing, the collection area and all purge piping should be kept from freezing while operating. If left in idle state under freezing conditions, the entire unit must be drained of liquid, and the collection area must be purged of solids.

NOTE:

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings are available. Consult factory.

THE
INDICATING
FILTER

Model 4-8 Indicating Bag Filters

Intelligent, mechanically actuated, Indicating Filters. Filters that tell the whole story.

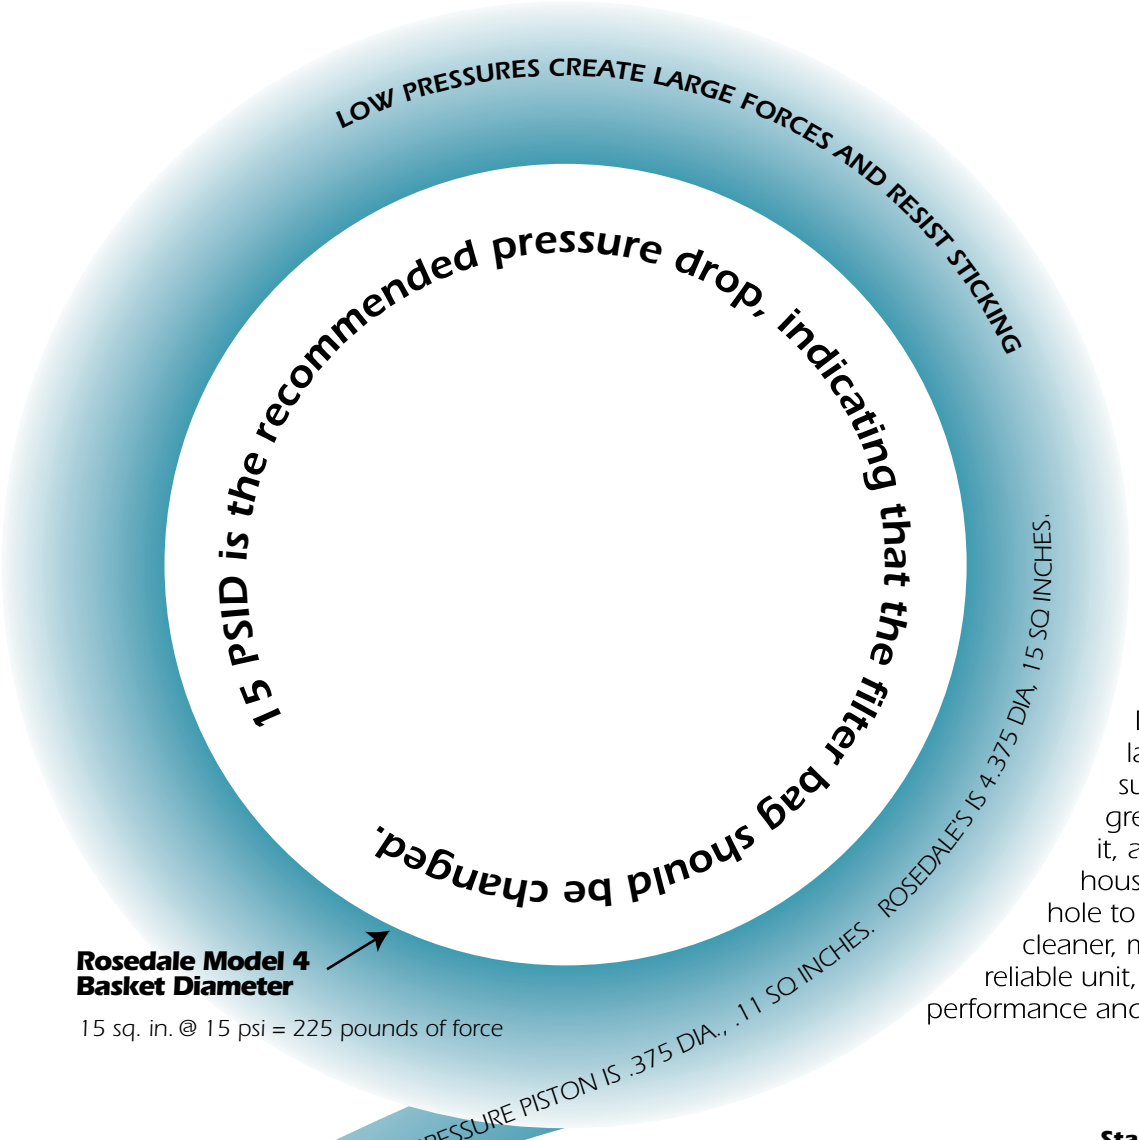
These filters will let you know when your filter bag needs attention. This allows you to maximize the efficiency of your operations and reduce system downtime by changing filters only when they really need it. You'll save time, money and effort, because you'll use each bag to its maximum capacity, since change-out will be based on the remaining life of the bag, not on someone's best guess.

New Features

- *Integral Differential Pressure Indicator (non-clogging)*
- *Electric Micro Switch included - 3-wire or 4-wire*
- *Electric Switch has dual actuation (one for* ***requires attention soon*** *and one for* ***requires immediate attention****)*
- *Optional explosion-proof Pneumatic Switch*
- *Optional Digital Model available*

Features

- *Low pressure drops*
- *Permanently piped housings are opened without disturbing the piping or requiring tools*
- *Covers are O-ring sealed*
- *Carbon or stainless (304 or 316) steel housings*
- *Housings are electropolished to resist adhesion of dirt and scale*
- *Large-area, heavy-duty baskets*
- *O-ring seals: Buna N, EPR, Viton® fluorelastomer, and Teflon® fluorocarbon resin*
- *Two pressure ratings-150 and 300 psi*
- *Indicating device is mechanical, no tubes or orifices to clog*



Rosedale Model 4 Basket Diameter

15 sq. in. @ 15 psi = 225 pounds of force

Piston Diameter

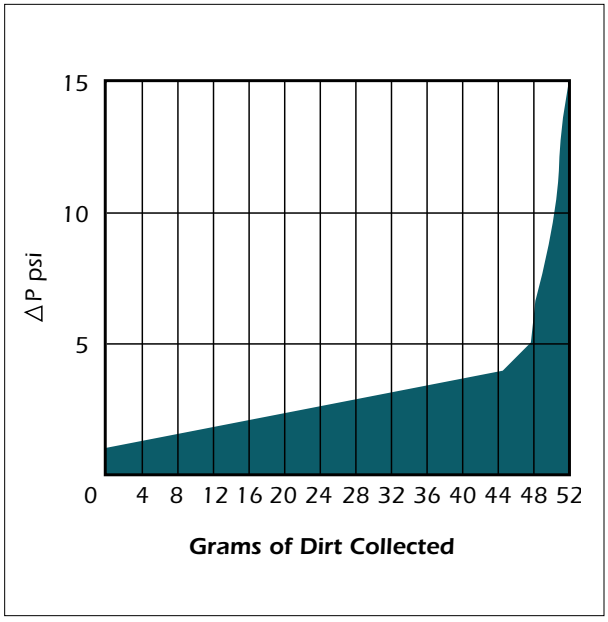
.11 sq. in. @ 15 psi =1.65 pounds of force

Most differential pressure indicators use a piston connected through a small hole in the side of the filter. This hole could clog, or the piston could easily be blocked or restricted. Rosedale's piston is much larger in diameter and surface area, requiring a greater blockage to restrict it, and since it is inside the housing, there is no outside hole to clog. It produces a cleaner, more accurate and reliable unit, providing excellent performance and value.

	Standard	Rosedale Model 4
Piston Diameter	**.38**	**4.38**
(F=P X A) Force Exerted @ 15 psi	1.65 lbs. of force	225.00 lbs. of force

As Amount Of Trapped Dirt Increases, Pressure Drop Increases, And The Remaining Life Of The Filter Decreases

That's right, as the pressure drop across your filter increases, additional dirt-holding capacity decreases. As the chart illustrates, at a 5 psi drop in pressure, over 90 percent of the filter's dirt-holding capacity has been reached. When the pressure drop has increased to 10 psid, it has reached 95 percent of its total dirt-holding capacity. For each additional 5 psi pressure drop, the amount of extra dirt retained decreases dramatically. As a matter of fact, pressure drops greater than 15 psi retain no appreciable amount of additional dirt. Our line of indicating filters automatically and intelligently sense these pressure differences, and will indicate when the optimum time to change the filter element in your system, saving you time, money and effort.



How To Order

Build an ordering code as shown in the example.

Example: **IND - 4 12 - 1P - 1 - 300 - C - B - BM - 200**

Convertible Filter Housings Use Either Bags or Cartridges

You can switch from one to the other instantly

The emergence of new, more effective filter bag materials has challenged the popular filter cartridge. Filter bags are now an attractive, economical alternative to cartridges in many applications. Bags cost less, are easier to install and remove, and require less room in storage and disposal.

The convertible filter housings from Rosedale offer you the ability to use filter bags in place of cartridges without burning your bridges behind you. You can always change back to cartridges, for whatever reason.

Features

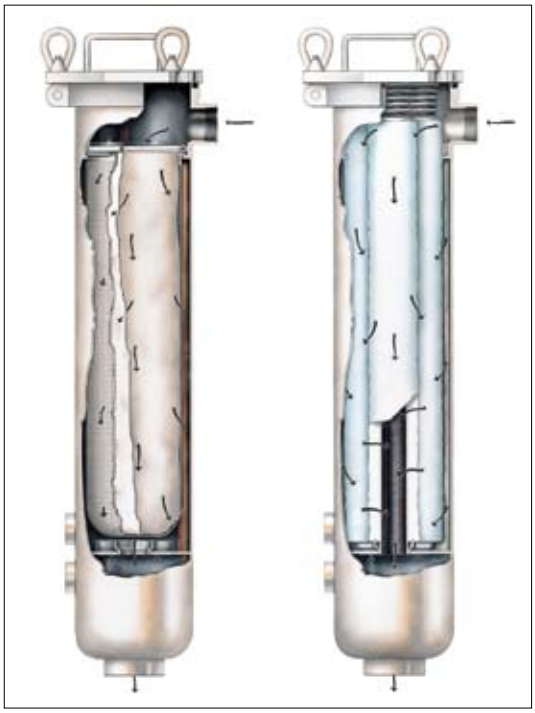
- Permanently piped housings–no repiping necessary for change-over
- Covers are O-ring sealed
- Designed for standard double open-end type cartridges. Can also be supplied adapted to other cartridge-end configurations
- Carbon steel, 304 or 316 stainless steel construction for housing
- All housings are electropolished to resist adhesion of dirt and scale
- ASME code stamp is available
- Adjustable-height legs are included
- V-post spring seal for both options are in 316 stainless steel

Options

- Filter bag hold-down devices
- Sanitary construction
- Different outlet connection
- Higher pressure ratings
- Extra-length legs
- Heat jacketing
- Duplex units

Flow Rates

Rosedale's convertible filter housings are offered in two diameters to hold 3 and 5 cartridges, respectively. The 3-cartridge housings are nominally rated at 70 gpm*. The 5-cartridge Series housings are nominally rated at 100 gpm*. These ratings are governed by the restrictive openings in the cartridge support plate. They do not take into account the pressure drops imposed by the bags or cartridges used.



Pictured is a Model 6330. It can hold three 30-in. long cartridges (shown inserted) or a filter bag and support basket (at left). The two 3/4-in. ports at the bottom of the housing are 1) a dirty liquid drain (upper port), and 2) a clean liquid drain (lower port). The dirty liquid drain need not be used when filter bags are employed; if bags are properly removed, no dirt washes off downstream. (The use of a liquid displacer makes this easier to do.)

*30-inch cartridge

6 8	**BM**	= Filter bag basket, perforated, mesh lined[4]
6 8	**M**	= Strainer basket, perforated, mesh lined
6 8	**HWM**	= Filter bag basket, heavy wire mesh[4]

BASKET SEAL

6	**N**	= None (Series 6300)
8	**S**	= Seal (Series 8500)

COVER SEAL

6 8	**B**	= Buna N
6 8	**E**	= Ethylene Propylene
6 8	**V**	= Viton®
6 8	**TEV**	= Teflon® Encapsulated Viton®
6 8	**TSW**	= Teflon® (solid white)

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. ANSI B16.5 Pressure/Temperature Rating Tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.
3. Displacers only usable with filter bag baskets.
4. Filter bags are specified separately. See page 150.

Manual Backwashing System

Manually-controlled system minimizes operator exposure and backwash fluid - ideal for hazardous environments!

Rosedale Products' Manually-Controlled Backwashing Filter:

- Minimizes backwash fluid
- Increases productivity
- Reduces process/system downtime
- Reduces maintenance costs
- Reduces labor costs
- Reduces filter element disposal and replacement costs
- Reduces operator exposure

Our backwashing filter uses standard 30 inch filter bags and baskets, providing over 600 square inches of filter surface area. The unit can be cycled through hundreds of backwashes before change-out is required. When pressure drop across the system is too great, indicated by the standard pressure gages, the system is easily cycled through the back-wash operation. Operation is simple, first closing the valves for the inlet and outlet, then opening the valve for the backwash outlet, which can be piped to a separate, safe location. Once that has been accomplished, simply depress the lever that shocks the system with factory air, causing the fluid in the housing to exit through the backwash outlet, removing the contaminant from the element at the same time. When the element is clean, usually in 30 seconds or so, simply return the three valves to their original positions to resume filtering.

Standard Features

- No-spill cover
- Permanently piped housings are opened without disturbing piping or requiring special tools
- Low-pressure drop
- Adjustable-height tripod legs
- 150 psi rated housing
- Pressure indicators for monitoring system efficiency

Standard Options

- Carbon or stainless steel housings
- Gaskets of Buna-N, Ethylene Propylene, Viton®, or Teflon®
- Valve Seats of Buna-N, Ethylene Propylene, Viton®, or Teflon®
- 150 psi ASME code stamp
- Air eliminator

Manually-controlled backwashing filter housing

How To Order

Build an ordering code as shown in the example

Example: **MBW 8 - 30 - 2P - 150 - S - B - B - C**

(Housing: MBW 8 - 30 - 2P - 150 - S; Options: B - B - C)

BACKWASHING FILTER = **MBW**

MODEL NUMBER = **8**

BASKET DEPTH
30-inch (std.) = **30**

PIPE SIZE, NPT & FLANGED
2-inch, female NPT (std) = **2P**
3-inch female NPT = **3P**
4-inch female NPT = **4P**
2-inch 150 class ANSI flange = **2F**
3-inch 150 class ANSI flange = **3F**
4-inch 150 class ANSI flange = **4F**

PRESSURE RATING
150 psi (NPT and flanged) = **150**

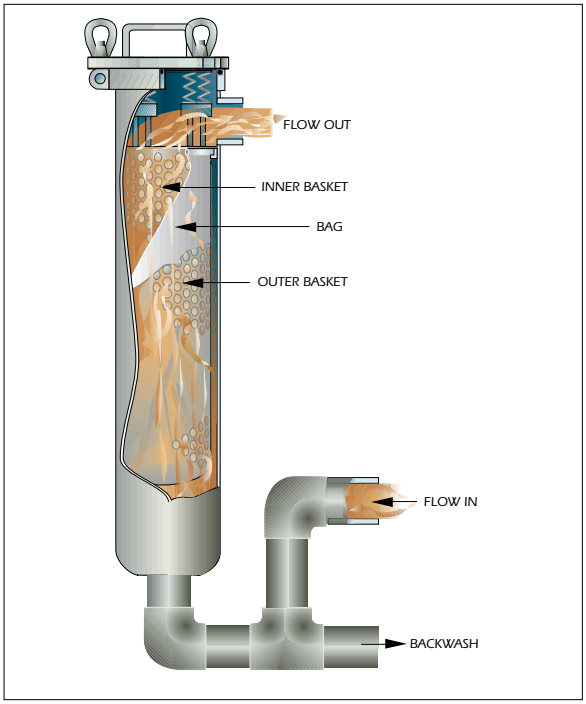
ASME CODE STAMP
C = Code stamp

VALVE SEATS
B = Buna-N
M = Ethylene propylene
T = Teflon®
V = Viton®

COVER SEAL
B = Buna-N
E = Ethylene propylene
V = Viton® Fluoroelastomer
TEV = Teflon® Encapsulated Viton®
TSW = Teflon® (solid white)

HOUSING MATERIAL
C = Carbon Steel
S = 304 Stainless Steel
S316 = Stainless Steel

NOTES:
1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME housings.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are ordered separately. See page 150.



How It Works

Fluid is introduced through the bottom of the filter housing. It is then forced through a filter element consisting of a bag rigidly contained between inner and outer baskets. The contaminant is captured on the outside surface of the outer basket and filter bag, while the clean fluid exits through the upper outlet. When the operator determines the unit needs to be backwashed, all valve positions are reversed, and the system is shocked by the introduction of factory air, causing the fluid in the vessel to exit through the backwash outlet, cleaning the element at the same time. To resume operations, just return the valves to their original positions.

Portable Filtration System

The Perfect choice for batch processing, or filtering from tanks or drums

This cart-mounted filter system has a diaphragm pump, pneumatic components and valves. The housing itself uses a standard size 12 bag. The clamp cover is easily removed and helps to reduce the time spent cleaning or replacing the bag. Rosedale's superior side-entry design does not allow contaminant by pass around the filter bag nor fluid to impinge the filter bag. It also prevents the spills and messes caused when opening. So for efficient, clean filtration, Rosedale is your choice.

Features

- Quick-opening covers that do not require special tools
- Carbon or stainless steel housings
- Large area bag and basket for greater dirt-holding capacity
- O-ring seals: Buna N, EPR, and Viton®
- 125 psi-rated housing
- Basket material is compatible with housing
- Uses standard number 12 size bags with surface area of 5.6 square feet.
- 1-inch NPT ports
- Air-operated, double-diaphragm pump
- Poly-Pro pump (optional)
- Cart has built-in drip pan and 9" air-filled tires
- Compressed air filter/regulator
- 10-foot inlet/outlet hoses with quick-disconnect couplings
- 25 gpm flow rate
- Four wheel cart optional

How To Order

Build an ordering code as shown in the example.

EXAMPLE: **PLC8 - 30 - 1P - 125 - C - B - PB**

PORTABLE LCO8 = **PLC8**

HOUSING SIZE = **30**

PIPE SIZE
1-inch female NPT = **1P**

PRESSURE RATING
125 PSI = **125**

BASKET TYPE
PB = Filter Bag Basket

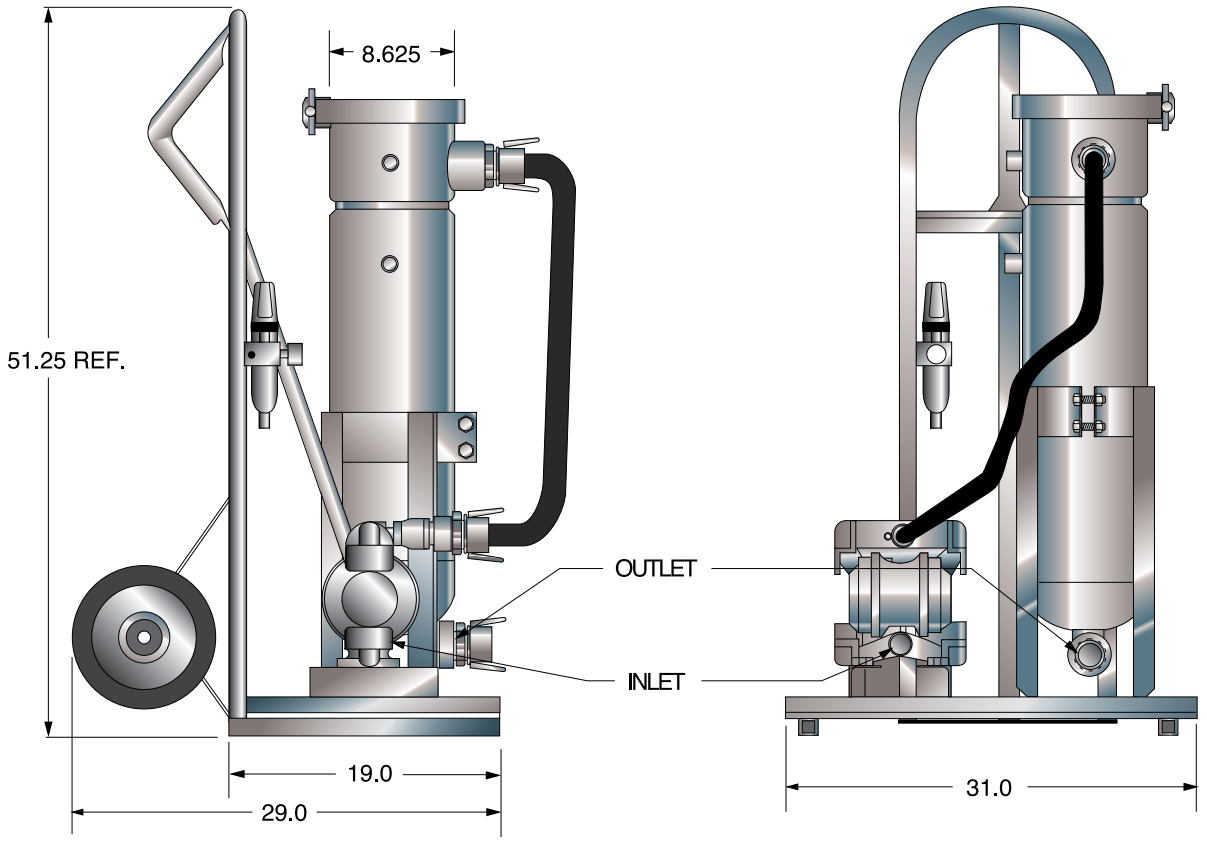
B = Buna N
E = Ethylene Propylene
V = Viton® Fluorelastomer

HOUSING MATERIAL
C = Carbon Steel with aluminum pump
S = 306 Stainless with stainless steel pump



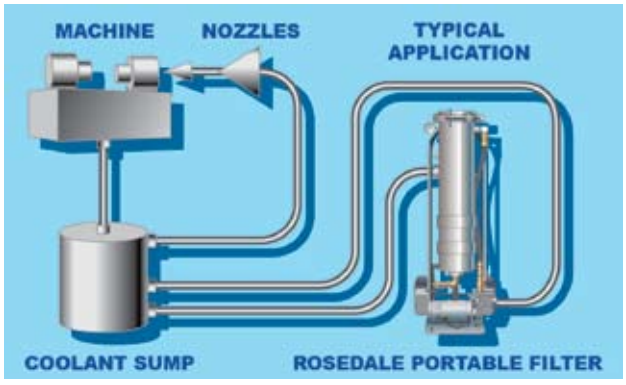
Portable Filter Cart For Coolants and Metalworking Fluids

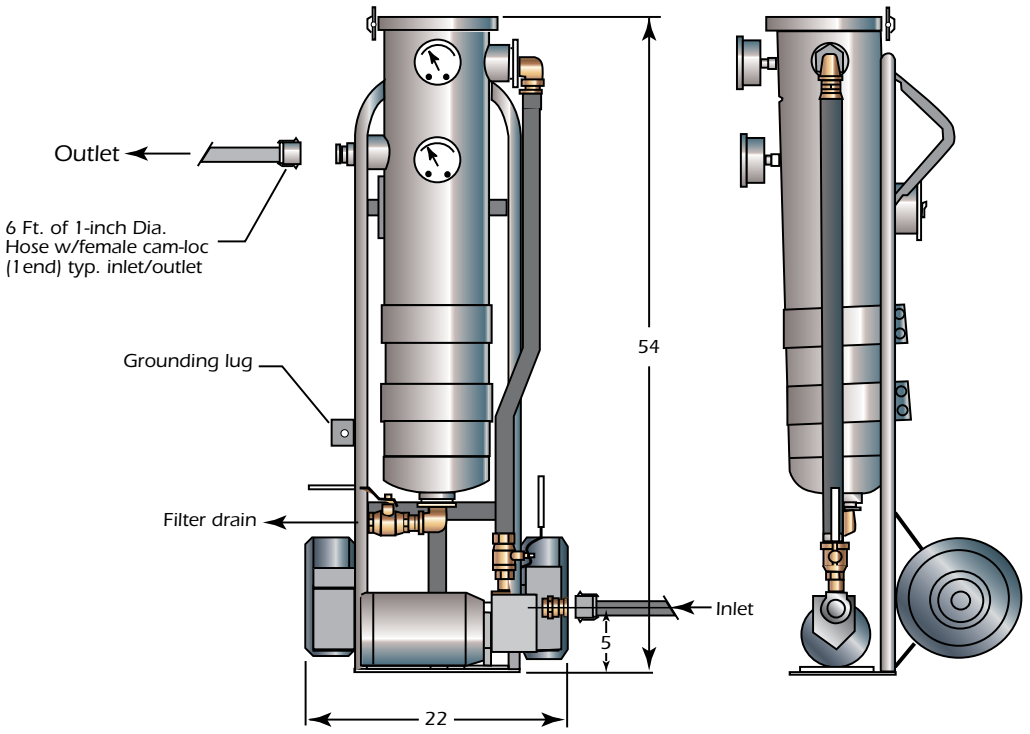
Rugged, Versatile,
and On the Move ...

This versatile portable filter cart (PFC), is easily movable from machine to machine, holding tank to reservoir, or drum to tank. These two wheel hand truck systems provide a means for pre-filtering and transferring fluids. They are most effective controlling particulate problems before they cause damage to critical production equipment. Rosedale's PFCs' high-flow, industrial quality centrifugal pumps transfer fluids quickly and economically.

Applications

Portable filter systems can be used with coolants and other fluids with viscosities of 300 ssu or less that are compatible with aluminum and steel. Most new fluids are unfit for use in hydraulic and lube systems. Contamination enters the fluid during processing, mixing, handling and storage. Solid particulate may be present in unacceptable levels. Portable filter carts are the ideal means of pre-filtering and transferring these fluids. With a 1/2 horsepower motor and bag filter housing, this two wheel hand truck system is used for fluids with viscosities of 300 ssu or less.





1" Self-Priming Centrifugal Pump Specs

GPH of Water at Total Feet of Head*					Max. Head

Coolant Filter Selection Guide

For low pressure machine tool coolant applications

Rosedale Filtration Products has installed a wide variety of systems throughout the metalworking and manufacturing industries. Our high quality industrial filters prevent metal chips, fines and other debris from contaminating cutting oils and coolants. Our pre-selected systems include the housing, appropriate seals and a filter bag.

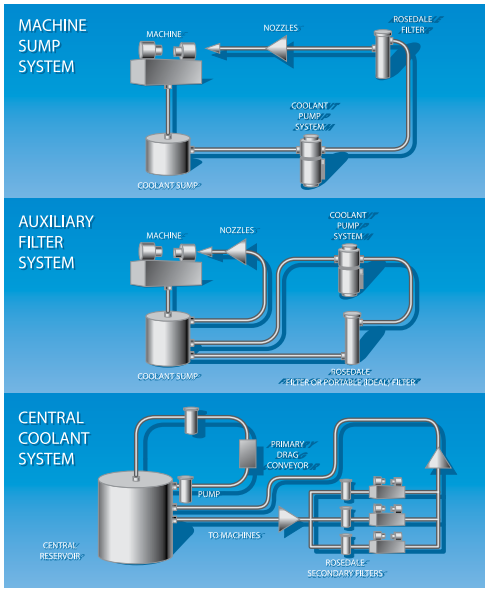
General Requirements and Measurements

There are important factors that enter into specifying the level of coolant cleanliness that will improve the finish and extend tool life. Variables that affect coolants include: full or partial filtration, single pass or recirculating flow, dirt loading, pressure drop through all components of the filter systems, coolant temperature, flow rate, system pressure, and the presence of tramp oil.

This filtration guide is intended to provide general information about industry specifications. Use the data to compare and evaluate your specific application.

Typical Applications

Our schematics illustrate how Rosedale filters can be easily installed in any coolant circuit. The versatile Rosedale filters can be used in all metalworking machines, including milling, boring, broaching, grinding, drilling, turning, etc.



Methodology

Charts, schematics and other information provided or referred to throughout this guide are intended as examples only. "Nominal" filter ratings are used and monthly throughputs are calculated to include the sizing of filter elements to provide a 30 day minimum life expectancy based on a typical dirt load ingression.

Rosedale offers the widest range of filters and filter bags, including oil-adsorbing, high temperature, high-capacity bags, high-efficiency liquid filter bags, and Beta Bag® filter bags. The term Beta Ratio or Beta Rating refers to the number of particles upstream divided by the number of particles downstream in a given size. For example, if there are 100 five micron particles upstream and 50 five micron particles downstream of the filter bag, then the Beta Rating for this filter in the five micron size is 100/50, or 2. In other words, the filter bag is said to have a Beta 5 of 2. The efficiency is 50% in the five micron range.

Recommended Clarity Levels Of Filtered Coolant Filtered coolant shall meet or exceed the following average clarity levels.	**Average Particle Size**	**Concentration: PPM**
Ultra Fine: Honing, microsizing, lapping, and polishing		**less than 10 microns**
	larger than 8 microns	5 PPM to 10 PPM
	between 1 to 8 microns	25 PPM to 50 PPM
Very Fine: Grinding, gun-drilling, gun-reaming (with tool diameters of 0.125 inch or less)		**less than 15 micron**
	larger than 8 microns	10 PPM to 15 PPM
	between 1 to 8 microns	50 PPM to 100 PPM
Fine: Tapping, milling, lathe, hobbing, drilling, boring, general machining		**less than 20 micron**
	larger than 8 microns	15 PPM to 30 PPM
	between 1 to 8 microns	100 PPM to 200 PPM

Single-Bag Filters

Model 4 Coolant Filter

For Flows to 5 gpm

Flows can be higher. These flows are selected to optimize dirt holding capacity.

(For more detail information and other specifications concerning the Model 4, please see page 4 or contact a Rosedale representative.)

These rugged and reliable bag filters are tailored to high-capacity applications yet are relatively low in cost, making these durable filtration devices one of the best values on the market. Choose from among the pre-selected ordering codes listed below for filter flows to 5 gpm with a 200 psi rated housing.

Coolant Filter: LCO4 -12 - 1P - 2 - 200 - C - B - N - PB

(Housing: LCO4 -12 - 1P - 2 - 200 - C; Options: B - N - PB)

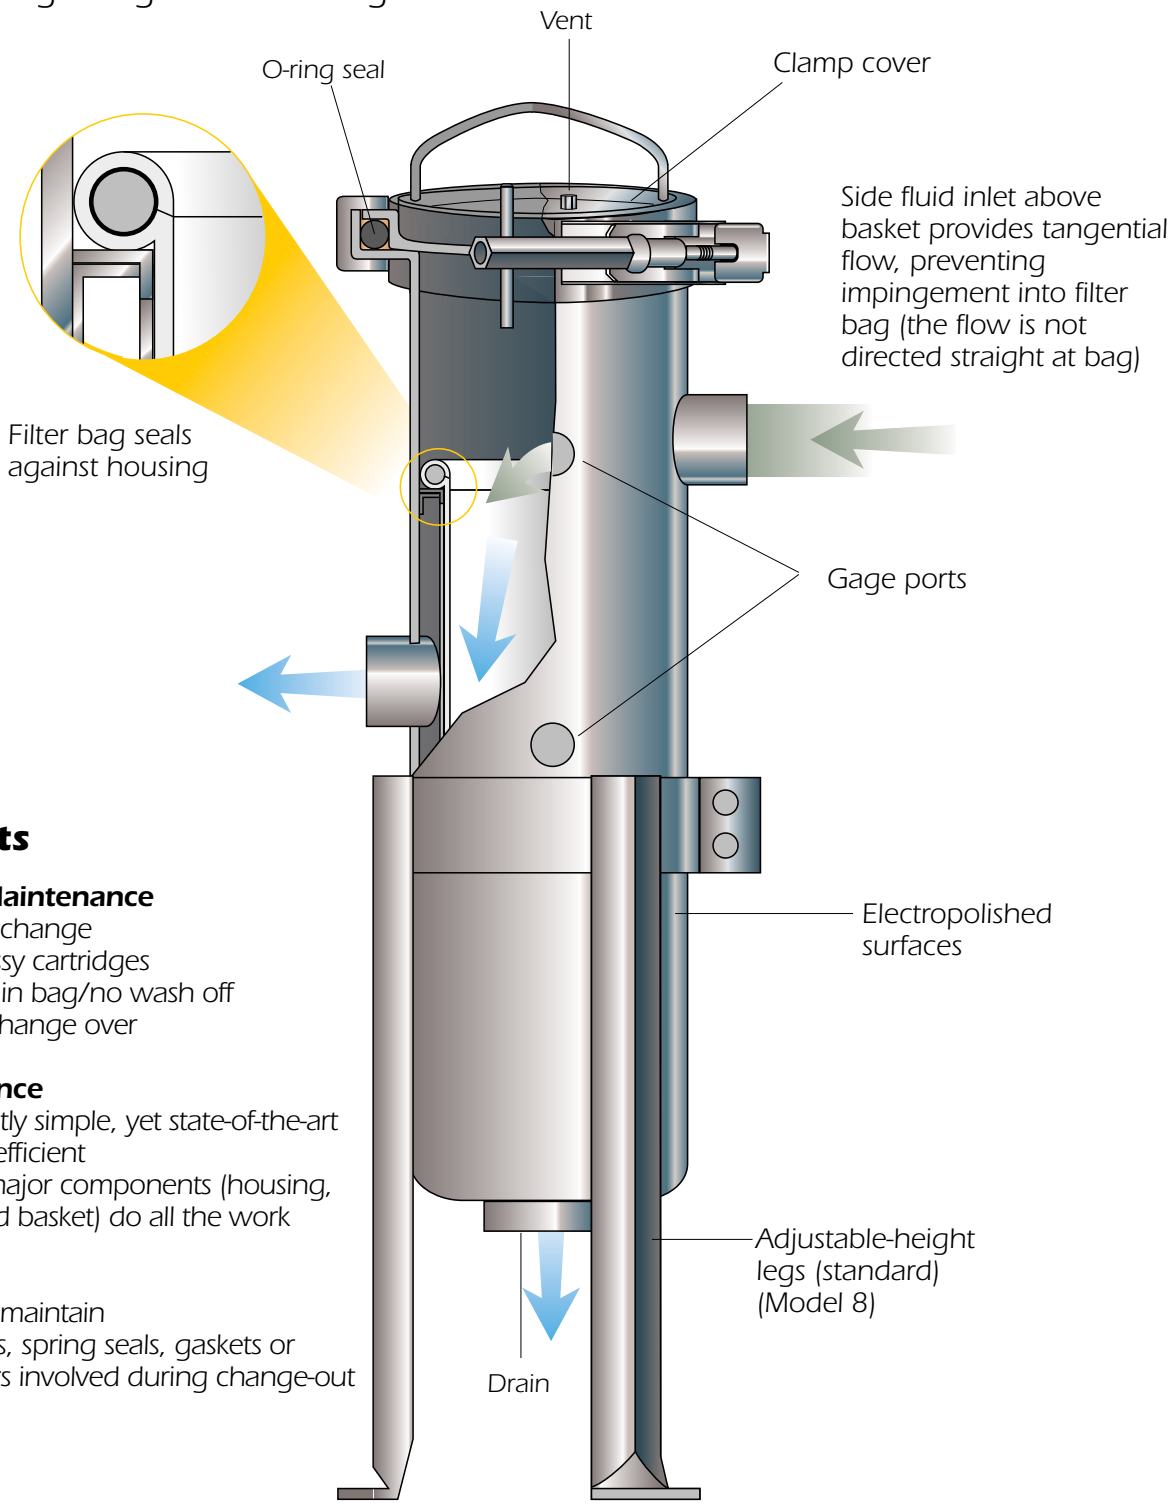
Features

Typical Single-Bag Filter Housing



Benefits

Ease of Maintenance

- Easy to change
- No messy cartridges
- Dirt left in bag/no wash off
- Quick change over

Performance

- Inherently simple, yet state-of-the-art
- Highly efficient
- Three major components (housing, bag and basket) do all the work

Service

- Easy to maintain
- No caps, spring seals, gaskets or adapters involved during change-out

Multi-Bag Filters

These multi-bag filters offer the widest range of flow capacities and contaminant holding capabilities. With anywhere from 2–23 perforated stainless-steel baskets specially fitted to hold disposable or cleanable filter bags, these high-capacity multi-bag filtration devices are extremely versatile. Bag sizes meet industry-wide standards: conventional 3–inch baskets take bag size 2 while optional 15-inch basket take bag size 1. The standard pressure rating for all models is 150 psi and all housing units can be supplied with a ASME code stamp, if required.

Choose from among the pre-selected ordering codes listed below. If you need assistance determining the size or type of product that suits your application, call a Rosedale representative today for assistance and information.

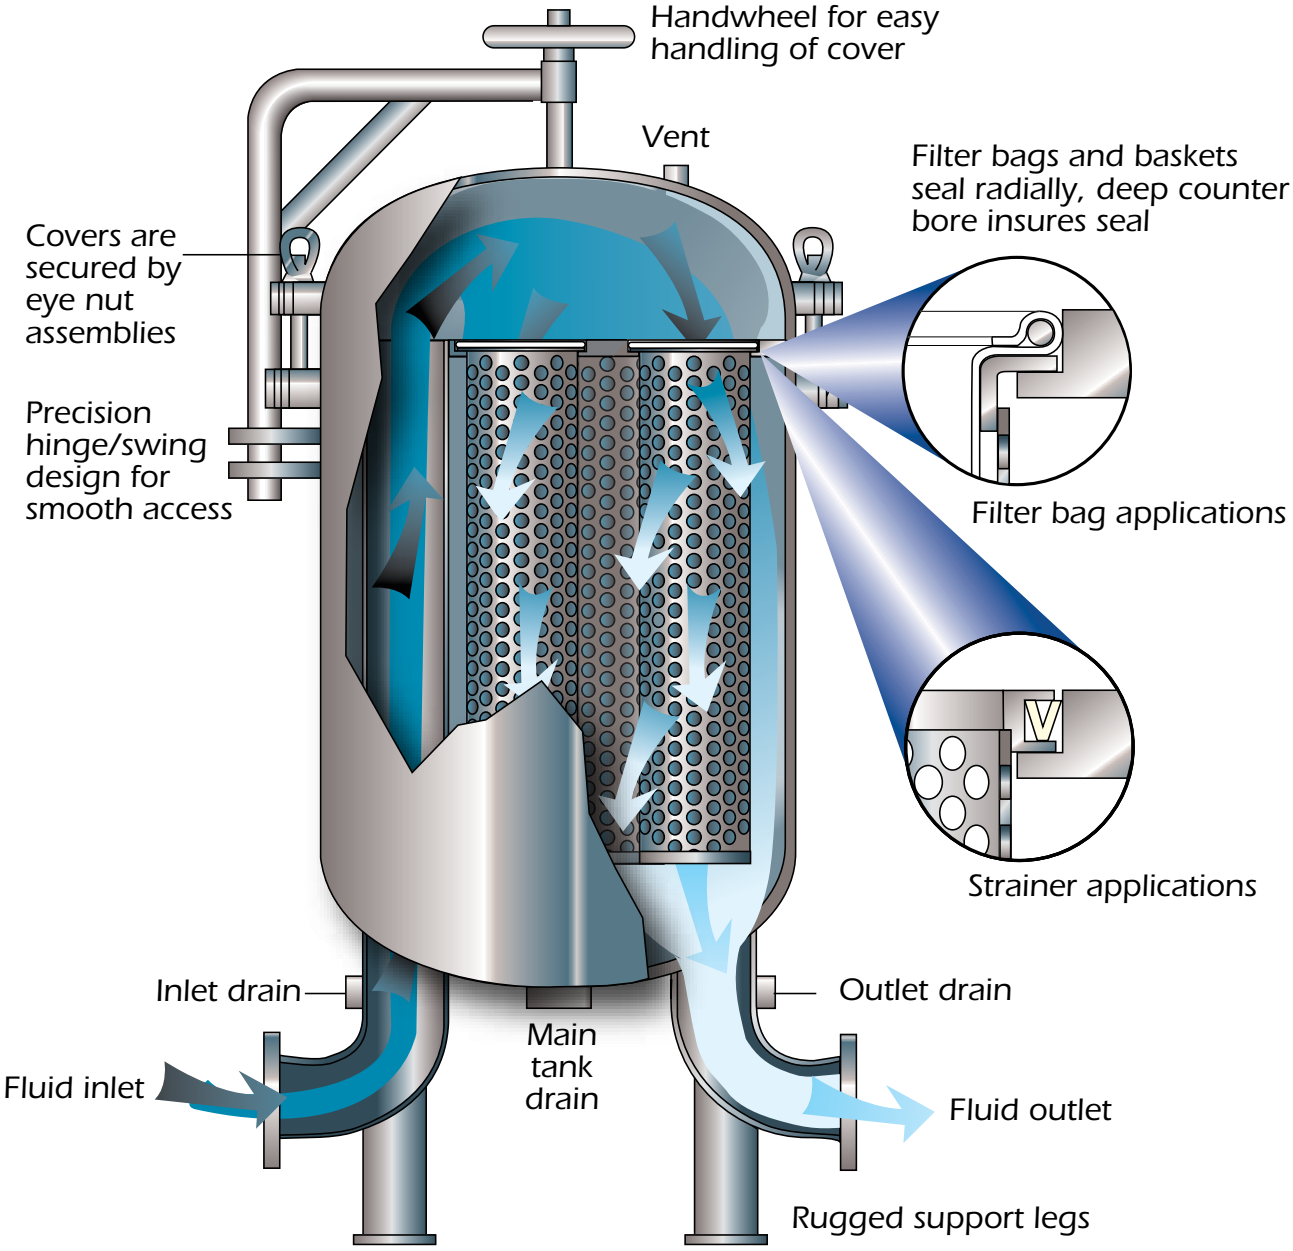
Typical Multi-Bag Filter Housing



Water Filter Selection Guide

Rosedale has installed many housings for filtering industrial water applications in industries as diverse as automotive, steel, metal fabrication, and paper processing, among many others.

The Generation II All Plastic Model 8 Bag Filter

(For more information on the Generation II, see page 33)

Rosedale's Generation II model 8-sized polypropylene bag filters are made in a one-piece, seamless body that offers excellent resistance to corrosion. It is rated to 100 psi @ 150°F and flows to 100 gpm, choose the pre-selected ordering code listed below.

Pre-Selected Corrosive Resistant Model 8 Ordering Code

Example: **CR8135 - 30 - 2F - * - 100 - P - B**

Extra High Capacity Multi-Bag Filters

(For more information on the Multi-Bag Filters, see page 39)

These multi-bag filters offer a wide range of flow capacities and contaminant holding capabilities. They contain from 2 to 23 baskets, all the same size. They are fitted with perforated stainless steel baskets designed to hold disposable or cleanable filter bags. Industry standard size bags are used: the standard 30-inch baskets take bag size 2, and optional 15-inch baskets take size 1. The standard pressure rating for all models is 150 psi. All housings can be supplied with a ASME code stamp, if required. For filter flows to 2300 gpm with a 150 psi rated housing, use the pre-selected ordering code listed on the next page.

PRESSURE RATING[2]
150 = 150 psi (flanged)

1. Flanges provided with the housing match the pressure rating of the vessel. Housings rated 150 psi have 150 class flanges. Housings rated 300 psi have 300 class flanges. Other styles and classes available. ANSI B16.5 Pressure-Temperature rating tables determine flange class for ASME code housings. Consult factory.
2. Higher pressure ratings available. Consult factory.
3. Filter bags are specified separately. See page 150.

Sanitary Service – Bag Filters for Fine Filtration

New multilayer, polyester and polypropylene felt filter bags make possible filtration to 1 micron

Rosedale sanitary service filters conform to USDA/3A dairy standards with housings of polished 316 stainless steel. They're rated for 200 psi pressure and have quick-release clamp-type covers. Outlets and inlets have sanitary flange connections. All internal surfaces can be visually inspected (and easily cleaned in place).

The great economy of these filters is in their use of filter bags instead of the more costly filter cartridges. Made of a new filtering media, they carry nominal retention ratings of 1, 10 and 12 microns. They have been evaluated by the Multi-Pass Test Method (OSU-F2). See page 159 for complete information. (Other bags, including some made of monofilament meshes rated as fine as 10 microns, are also available.)

The contaminant-carrying capacity of these bags is equal to that of cartridges of the same flow capacity. Because the filter bags are supported by perforated stainless steel baskets, there is no filter collapse, flow fatigue, or filter end-load problems. Bags are removed more easily than cartridges, and bags hold the contaminant inside, not outside where it can wash off into the system during replacement. Some filter bags can be safely used at temperatures to 325^{0}F.

Applications for these filters include dairy, beverage, vegetable oils, and other foods and pharmaceuticals. They also make excellent pre-filters upstream of ultra-fine cartridge and membrane filters removing bacteria, etc.

PRESSURE RATINGS	Maximum Pressure @ 70°F	Maximum Pressure @ 250°F
Model 4	200 PSI	125 PSI
Model 8	100 PSI	50 PSI

How To Order

Order filter bags separately.
See page 150.

Construction

Housings are of 316 stainless steel, polished inside and out (unless ordered otherwise). The bags are supported by stainless steel baskets that provide 50% open area and lift out easily. The housing is then completely open with all surfaces visible and cleanable.

The filter bags have stainless steel rings sewn in their openings. Their close fit inside the housing effectively seals against bypass of liquid. They have cloth handles to assist in removal.

T-Type Sanitary Cartridge-Housing

For fine filtration

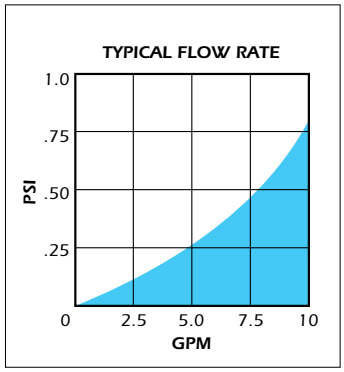
Rosedale's sanitary service filters for sterile filtration are constructed with housings of electropolished 316 stainless steel. This "T" type sanitary housing is rated for 150 psi pressure and has a quick-release clamp closure which is safe for compressed gas applications. Outlets and inlets have sanitary flange connections. All internal surfaces can be visually inspected and easily cleaned in place. The housing uses an industry standard 222 or 226 style cartridge.

Applications for this sanitary filter housing include dairy, food and beverage processing, sterile filtration for pharmaceuticals, and sterile air/gas filtration. They are also excellent pre-filters used upstream of membrane filters.

Construction

Housings are all welded construction with all wetted parts of 316 stainless steel. All welded attachments are 300 series stainless steel. The materials and manufacturing process exceed industry standards for sterile filtration.

See pages 193-202 for sanitary use filter cartridges.



How To Order

In-Line Sanitary Cartridge Housing

Rosedale in-line sanitary cartridge housings are constructed of electropolished 316 stainless steel for sterile filtration. They are rated for 150 psi pressure and have a quick-release, clamp-type closure. A recessed filter connection reduces hold-up volume and ensures a proper O-ring seal.

The in-line design features a sanitary purge valve that ensures proper venting for complete filter wetting. There's also a sanitary drain valve ensuring proper liquid drainage during venting applications. This sanitary filter housing uses an industry standard 222 or 226 style cartridge.

Sanitary USDA/3A Standards

Applications for this housing include sterile venting, sterile air/gas filtration, food and beverage processing, and sanitary applications requiring high purity, non-reactive surfaces. They are also excellent pre-filters used upstream of membrane filters.

Construction

Housings are all welded construction with all wetted parts of 316 stainless steel. All welded attachments are 300 series stainless steel. The materials and manufacturing process exceed industry standards for sterile filtration. A cast clamp closure connects the shell to the base assembly.

Rosedale Bulk Loading Filters

Know your liquid products are clean upon delivery - and be able to prove it! For flow rates to 50 gpm

Here is a way to ensure that the liquid chemicals or petroleum products you put into bulk containers - from drums to tanks cars - are as clean as they should be.

This final filter uses low-cost filter bags with dirt retention capabilities as fine as one micron. The filter attaches to the end of your loading pipe or hose, so it's the last thing your product touches before being loaded. It will stop any contaminant that has escaped your regular filtering system.

The filter can be attached to your line by a standard quick-connect coupler for easy removal. The cover is held closed by an easy-operating clamp - no tools required. It acts to hold the bag down in proper position, also. The filter bag can be quickly removed after loading for inspection. This will indicate your system filtration condition, and the bag can also serve as proof of the cleanliness of the product delivered. (Just send the bag along with the shipment.)

Description

The filter is of welded construction, in carbon or 304 stainless steel. It weighs approximately nine pounds. The filter bag basket is of perforated 304 stainless steel.

It uses standard-sized filter bags, #3 or #4. We offer them in many materials and micron ratings. If filter bags aren't desired, you can order units with strainer baskets, in a wide range of perforation hole sizes and with wire cloth linings as fine as 200 mesh.

How To Order

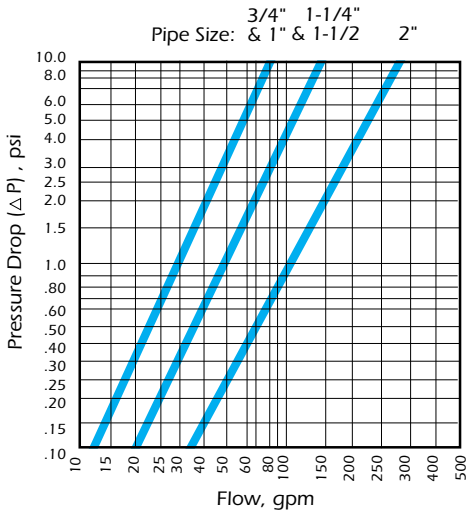
Model 4–For flow rates to 50 gpm

- Pipe sizes 3/4 thru 2-inch, NPT or flanged
- Two basket depths: 6 or 12 inches (nominal)
- Three pressure ratings: 200 psi (with clamp cover) and 300 or 500 psi (with eyenut cover)
- ASME code stamp available



Sorbent Containment Systems

- Treatment vessels
- Carbon-holding baskets
- Activated carbon packs

Treatment Vessels are standard Rosedale strainer/filter housings, available in carbon steel, and 304 or 316 stainless steel. They are made in many sizes. Single-basket models are pressure rated from 75 to 500 psi, with pipe connections from 3/4-in.-NPT to 4-in.-flange. Multi-basket models can hold from 2 to 23 baskets and are pressure rated at 150 psi. Pipe sizes are from 2 to 12 inches (flanged).

Sorbent-Holding Baskets are made in two styles: the RS, for recirculating systems, passes liquid (horizontally) through a shallow bed (approximately 2-1/2 inches deep); the SP, for single-pass systems, has a deep (vertical) bed (approximately 29 inches deep).

Baskets are made entirely of 304 stainless steel, and are of high quality construction. They are easily recharged with sorbents such as activated carbon. Turning the large lifting handle opens a cover so that they can be emptied and refilled. The particles are retained by 100-mesh wire screening.

These baskets can also be filled with materials other than activated carbon. Other processing media might include deionizing resin beads, silica gels, alumina, green sand, and odorizing agents.

Activated Carbon Packs are pre-measured amounts of 20 x 50-mesh-size activated carbon, packaged to protect against moisture. A universal grade of carbon is used, offering good flow rates.

An SP-style basket being put into a Rosedale Model 8-30 vessel. An RS-style basket is in the foreground.

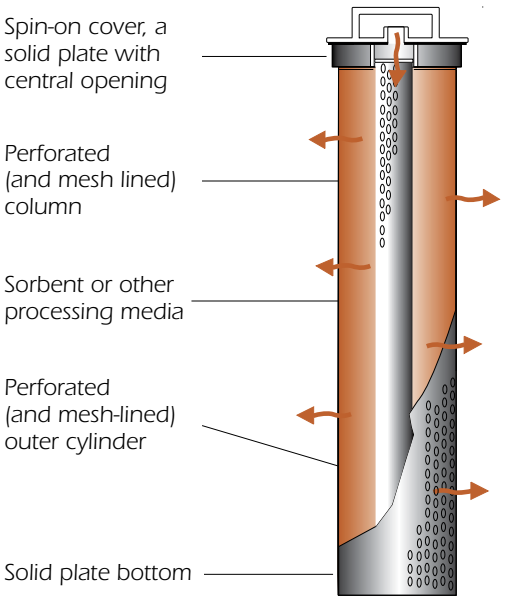
Designing An Optimum System

While carbon granules can act as a filtering media to remove solid particulate from a liquid, it is far more economical to pre-filter liquids entering a carbon adsorption vessel to avoid impeding the adsorption process. It is also recommended that a second filter be placed downstream of the carbon unit to catch any carbon particles that might be flushed out by the fluid stream. Rosedale bag filters are excellent in these roles.

A combination carbon adsorption and downstream filtering unit can be ordered. Available in the larger single-basket and all multi-basket vessels, it positions the carbon-holding basket inside a larger filter bag-holding basket. A variety of filter bag media is offered.

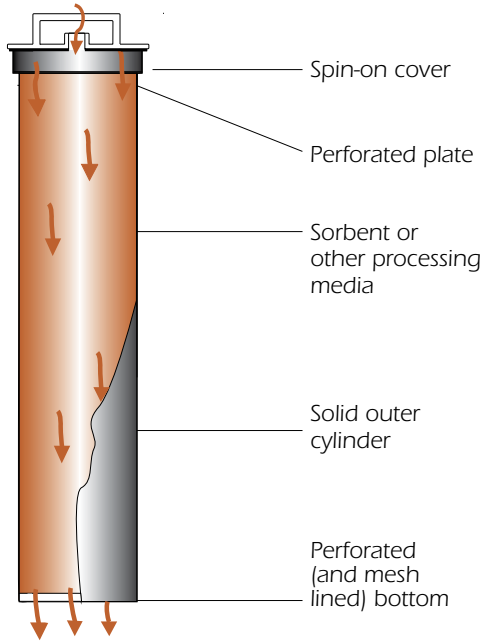
RS Style For Recirculating Systems

Flow enters from the top, into a perforated cylinder around, which is packed activated carbon. Flow moves radially through the carbon and exits through the side wall, which is perforated and lined with 100-mesh screen.



SP Style For Single-Pass (1-Time) Processing

Flow enters from the top through a perforated cover and into the activated carbon bed. Flow moves down through the carbon and exits through the bottom plate, which is perforated and lined with 100-mesh screen.



Activated carbon is a "black magic" material that removes molecules of organic pollutants from various liquids by physical adsorption. (It does not act by chemical bonding.) It is a surface attraction, and the fine porous carbon particles have an incredibly large surface area. (Used carbon can be reactivated by oxidizing the adsorbed contaminant.)

Uses of carbon adsorption include:

1. Purification of sugar syrups, liqueurs, glycerine, pharmaceuticals, etc.
2. Treatment of water to remove chlorine and odor, and improve color and taste.
3. Purification of process effluents, per EPA requirements.
4. Drying, degumming, and decolorization of fuel and lubricants, organic solvents, vegetable oil, and animal fats.

Treatment Vessels

Any of Rosedale's standard single or multi-bag housings can be used as the treatment vessel. See pages 4-225, 31-47, 78-84, 88-89, 100-103.

Activated Carbon Packs

Order carbon packs by using the basket order number (as shown below) plus the suffix 'CP'.

Example:
To order a replacement pack of carbon in an amount sufficient to fill an O-730-RS basket, order number O-730-RS-CP

*Flow rate is per basket: Multiply by number of baskets in vessel.

An All-Stainless Steel Mini-Bag Filter For 3000 psi Service

Ideal for spray nozzle protection

Here's the best answer yet to the need for a small yet rugged final filter for liquids at pressures to 3000 psi. The filter contains a stainless wire mesh "bag" with a 14 square inch area. It can be thrown away when dirty, or cleaned and reused. Flow is from the inside to the outside of the element; contaminant stays trapped inside. The straight through design has no elbows, turns or internal pockets to create pressure drops or collect sediment, and they're easy to flush out.

The mini-bag filter is very easy to service too. Just spin the knurled collar loose, push the housing out of line a bit, remove the element, slip a new or clean one in, and you're back in business. The seal is a special, Teflon-encapsulated Viton O-ring. It can be tightened by turning the knurled collar, usually by hand.

Specifications

- Pressure rating: 3000 psi
- Differential pressure rating: 25 psi
- Port sizes: 3/8 inch NPT
- Micron retention ratings (absolute): 25, 50, 75, 100 125 and 150

How To Order

Order filter housings separately:
Model No. MF-1

Order element bags separately, according to micron retention desired:

25 micron (absolute),	Part No. MB-25
50 micron (absolute),	Part No. MB-50
75 micron (absolute),	Part No. MB-75
100 micron (absolute),	Part No. MB-100
125 micron (absolute),	Part No. MB-125
150 micron (absolute),	Part No. MB-150

NOTE: A model with 2 collars, to be removed from rigid piping, is also available.

Flow Capacities (gpm)
at 2 psi (.14 bar) pressure drop

Viscosity (SSU/cSt)	Element Micron Rating 150	75	50	25
100/20.5	6	6	6	6
250/55	6	6	5.3	4
1000/250	4.5	4	3.1	2
1500/325	3.5	3.5	2.3	1.5

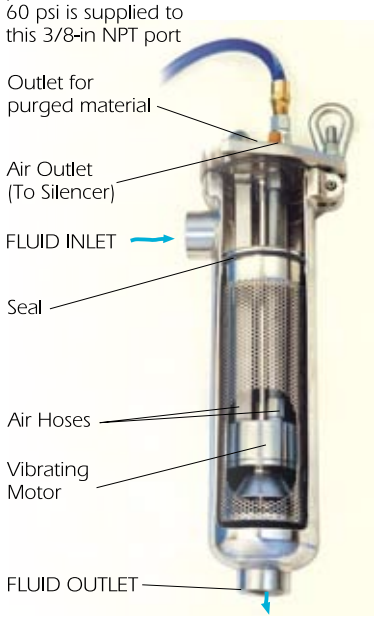
The Vibrating Filter

High-frequency sieving action prevents rapid filter loading

The Rosedale Vibrating Filter prevents filter cake from forming on the element surface. As in sieving, the screen through which the product passes is rapidly agitated. This prevents the building up of even smaller particles on larger ones stopped at the screen. By keeping over-sized material bouncing off the screen, the smaller particles can reach the screen and pass through. This sieving-type filter is ideal for paints, medicines, paper coatings, foods, or any product containing desirable solids that can be classified by size.



Unlike standard sieving, the vibrating filter works in a closed, pressurized system that greatly increases throughput. The high-frequency vibration also serves to delump agglomerated material.

The vibrating filter contains a perforated stainless steel basket lined with either stainless wedgewire or wire cloth. An air-driven vibrating motor at the bottom causes the basket to vibrate. The vibration rate is changed by varying the air pressure. Higher pressures produce higher frequencies. The basket is isolated from the housing, so very little vibration is transmitted to housing and piping.

Cleaning The Filter

- Release system pressure, and close inlet and outlet valves. Turn off the air to the vibrating motor.
- Loosen the eye nuts enough to swing rod ends free of the cover. Open the drain valve at the outlet to remove the remaining clean fluid.
- Remove cover-vibrator-basket assembly straight-up for the housing. (Contaminated fluid will now drain from the housing.)
- The easiest method for cleaning the unit is to run the vibrator while the basket is immersed in solvent. If this isn't effective, the basket must be removed and cleaned by hand.
- Separate the filter basket by removing the cotter pin, castle nut and lock washer. If the basket doesn't break free, tap the top of the basket lightly. If that fails, tap the stem down on a wood board to break the basket loose.
- Use brushes, solvents, compressed air, or other suitable means to remove the contaminant from the wire cloth or wedgewire element. Be careful no to damage the basket with sharp instruments.

Single Stage Giardia Cryptosporidium Removal

Municipal Drinking Water Filters

THE HOUSING

The Rosedale Model 8302P or Model NCO8135

Stainless Steel Housings

The Model 8302P and NCO8135 high-capacity filters offer an exceptional value in Giardia Cryptosporidium Removal applications. The system is approved for use in Colorado and Oregon and has met all the EPA LT2 guidelines.

Each housing provides large containment capacity combined with a rugged design rated to 150 psi. It incorporates an eyenut cover that is easily removed, reducing time spent on cartridge change-out.

Features

- NSF 61 listed
- Low pressure drops
- Permanently piped housings
- Covers are O-ring sealed
- 304 stainless steel construction
- All housings are electropolished to resist adhesion of dirt and scale
- Adjustable-height legs, standard
- ASME code stamp available

NSF
Certified to NSF/ANSI 61

Model 8302P

	Virus	Giardia	Cryptosporidium		
Filter Bag: PS-740-PPP-356	0	3	2 Log	20	30

THE ELEMENT

PS-740-PPP-356 Filter Cartridge

Maximize dirt-holding capacity and meet LT2 requirements

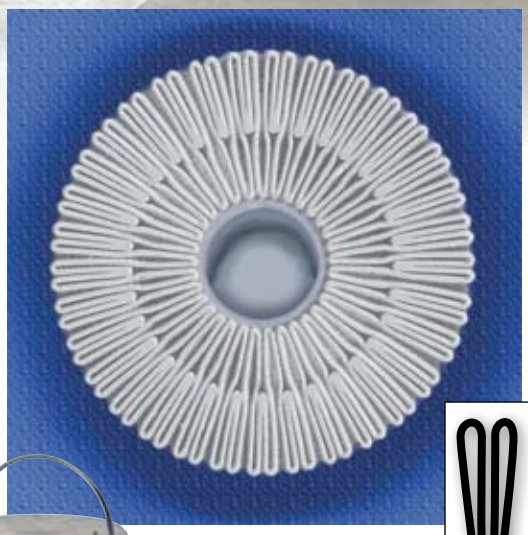
PS-740-PPP-356 elements are manufactured in a unique "Y" pleat arrangement that optimizes physical size and maximizes effective surface area. The large surface area provides a low fluid flux rate maximizing dirt containment.

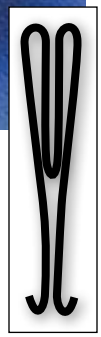
The element fits into the Rosedale NCO8135 housing or can retrofit 8302P housings with an adaptor basket. The end caps are heat sealed for high efficiency performance. The o-ring seal insures sealing and eliminates bypass.

Features

- 100 sq. ft. of surface area maximum
- 11 lbs. (approx.) of dirt carrying capacity
- 2 log cryptosporidium credit
- Flow rates to 10 gpm
- 6.25-inch diameter and 35-inch length
- Fits into standard Rosedale Model NCO8135 and 8302P
- Double o-ring seals
- NSF 61 listed

NSF®
Certified to NSF/ANSI 61





Cutaway of 740 Cartridge. The "Y" pleat maximizes effective surface area.

Retrofit Current Sites

Existing installations using the Rosedale 8302P and PS-520-PPP-241 or GLR-PO-825-2 can easily convert to a single housing by installing the PS 740 adaptor basket.

This is accomplished by replacing the perforated filter basket with the adaptor. The solid side basket accepts the new PS 740 cartridge and directs the flow through the unit.

Dual Stage Giardia Cryptosporidium Removal

THE HOUSING

Rosedale has developed an effective water filtration system that meets the SWTR and protocols for most states. This system offers a dual-stage design that filters out larger contaminants before filtering out micro-organisms.

The system consists of two high-quality Rosedale **Model 8 housings** (pressure vessels), placed in series.

The first stage is fitted with a **PS-520-PPP-241** bag/cartridge.

The second stage is Rosedale's **GLR-PO-825-2** bag/cartridge.

This provides a 2 LOG cryptosporidium credit when used in tandem. The optimum flow rate for the system described is 13 gallons per minute (GPM).

Rosedale manufactures filtration systems for larger applications, that can filter water up to 500 GPM. Multiple designs are available to meet your needs.

Final Filter: GLR-PO-825-2					GLR-PO-825-2: $\Delta P = 2.5$

Filter Housings and Cartridges are NSF 61 Listed

Pre-Filter

GLR-PO-825-2

PS-520-PPP-241

THE ELEMENTS

Pre-filter (Optional)

All graded-density bags are constructed of nine-layers of polypropylene micro fibers and standard fibers that are variably calendered. Heavy-duty handles are sewn and turned inside out to avoid leakage and enhance their pressure capacities.

Final Filter (2 Choices)

1–*The Rosedale GLR-PO-825-2 element has 26 layers of high-efficiency polypropylene micro fiber material, encased in a rigid support cage. The initial layers are pre-filtration levels, while the next several layers filter the cyst pathogen itself. The final barriers prevent any material from migrating into the effluent. All GLR units have a specially designed gasket to assure a bypass-proof seal. All seams and joints are heat sealed to prevent leakage. The inside-out flow design traps contaminants on the inside, reducing the possibility of downstream contamination during changeout and simplifying the service process. NSF 61 listed.*

2–*The PS-520-PPP-241 filters are manufactured in a "Y" pleat arrangement that optimizes physical size and maximizes effective surface area. The large surface area provides a low fluid flux rate maximizing dirt containment. This means element life is extended. NSF 61 listed.*

Rosedale Products' Cyst Reduction system provides easy installation, operation, and maintenance for a cost-effective solution to water treatment not previously realized by high-cost conventional systems.

FILTER ELEMENTS
1 GDP05232 and 1 GLRPO825P2 = **B**

Typical 2-Stage System — Included Components

5 2-inch butterfly valve (hand actuated) used for isolation and drainage

1 0-60 psid differential pressure gauge (stage 1)rolling diaphragm

1 0-30 psid differential pressure gauge with switch, NEMA 4 enclosure (stage 2) rolling diaphragm

2 1/4 inch vent valve (ball valve)

Two stage systems are approved in Alaska, California, Washington, Oregon, Vermont, Maine, and Minnesota. Meets the SWTR and protocols for most states.

Platinum 520 ABSOLUTE-RATED Bag-Sized Cartridges

Maximum dirt-holding capacity

Features

- 50 sq. ft. of surface area
- 8 lbs. (approx.) of dirt carrying capacity
- Rated 0.5 micron, 2 LOG cryptosporidium credit when used in tandem with the Rosedale GLR-PO-825-P2
- Flow rates to 20 gpm
- 6.25-inch diameter and 24-inch length
- Fits into standard Rosedale Model 8, and Multi-cartridge housings
- NSF 61 listed

These elements are manufactured in a unique "Y" pleat arrangement that optimizes its physical size and maximizes effective surface area. A low fluid flux rate maximizes dirt containment. This means element life is extended.

Design Details

The element fits into Rosedale standard size 2 baskets and functions similar to a bag (dirt is caught inside). The end caps are heat sealed for high efficiency performance. The o-ring seal insures sealing and eliminates bypass.

FINAL FILTER Filtration Unit - Design Information

Item Description	Information
Model Number	GRL-PO-825-2
Filter and System Information	
Type of Filtration Unit	Cartridge / Bag
Filter Material Description	Polypropylene
Absolute/Nominal Pore Size, Lower Cutoff Particle Size	0.5 Microns
Final Filter Life Expectancy	At the accumulation of approximately 1.2 lbs solids
Number of Filtration Units/Banks	2
Vessels	2
Filter Connections	2" NPT or Flange
Testing Results	
NSF, ETV, Other 3rd Party Verification Testing?	NSF 61, State of California
NSF Standard 61, FDA, Certification	Yes
Pilot Study Data?	Yes
Removal Efficiency and Credits	
Treatment Log Removal Credits	2.0-Log Giardia and Cryptosporidum
Targeted Removal Efficiency	99%
Targeted Turbidity	0.1 NTU
Flow rate, Pressure, Etc.	
Flux Rate (gsfd)	13-20 GPM per (2) Stage System
Filter Surface Area	4.4 ft^2 Final / 50 ft^2 Prefilter
Peak Flow Rate (GPM)	20 GPM
Continuous Flow Rate (GPM)	13 GPM
Minimum, Maximum Inlet Pressure	10 PSI Min. / 150 PSI Max.
Differential Pressures - Operating, Maximum, Setpoints/Alarms	Maximum ΔP, 15 PSID Post 30 PSID Prefilter
Raw Water Quality	
Pre-Sediment/Pre-Treatment (screening, oxidation, cartridge/bag filters, dechlorination)	Yes
Colloidal Particles: Pretreatment requirements or reduction of filter life	Yes
Source Water Limitations	High NTU >5
pH Limitations	No
Inorganics/Organics (Fe, Mn) Fouling Problems	Possibly
Water Temperature Range, Any Flow Rate Impacts?	No
Pre-Chlorination/Oxidation -Incompatibility with Filter? pH <10?	No
Design Considerations	
Process Flow Description	2-Stage Filter Unit
Raw Water Flow Meter, Rate Control	As Requested
Redundancy of Critical Components -Valves, Air Supply, Computers, PLC?	As Requested
Protection from Water Hammer	Needed
Pressure Gages for Pressure Drop Across Filter	Yes
Replacement Parts	Elements, Gaskets
O & M Manual	Yes

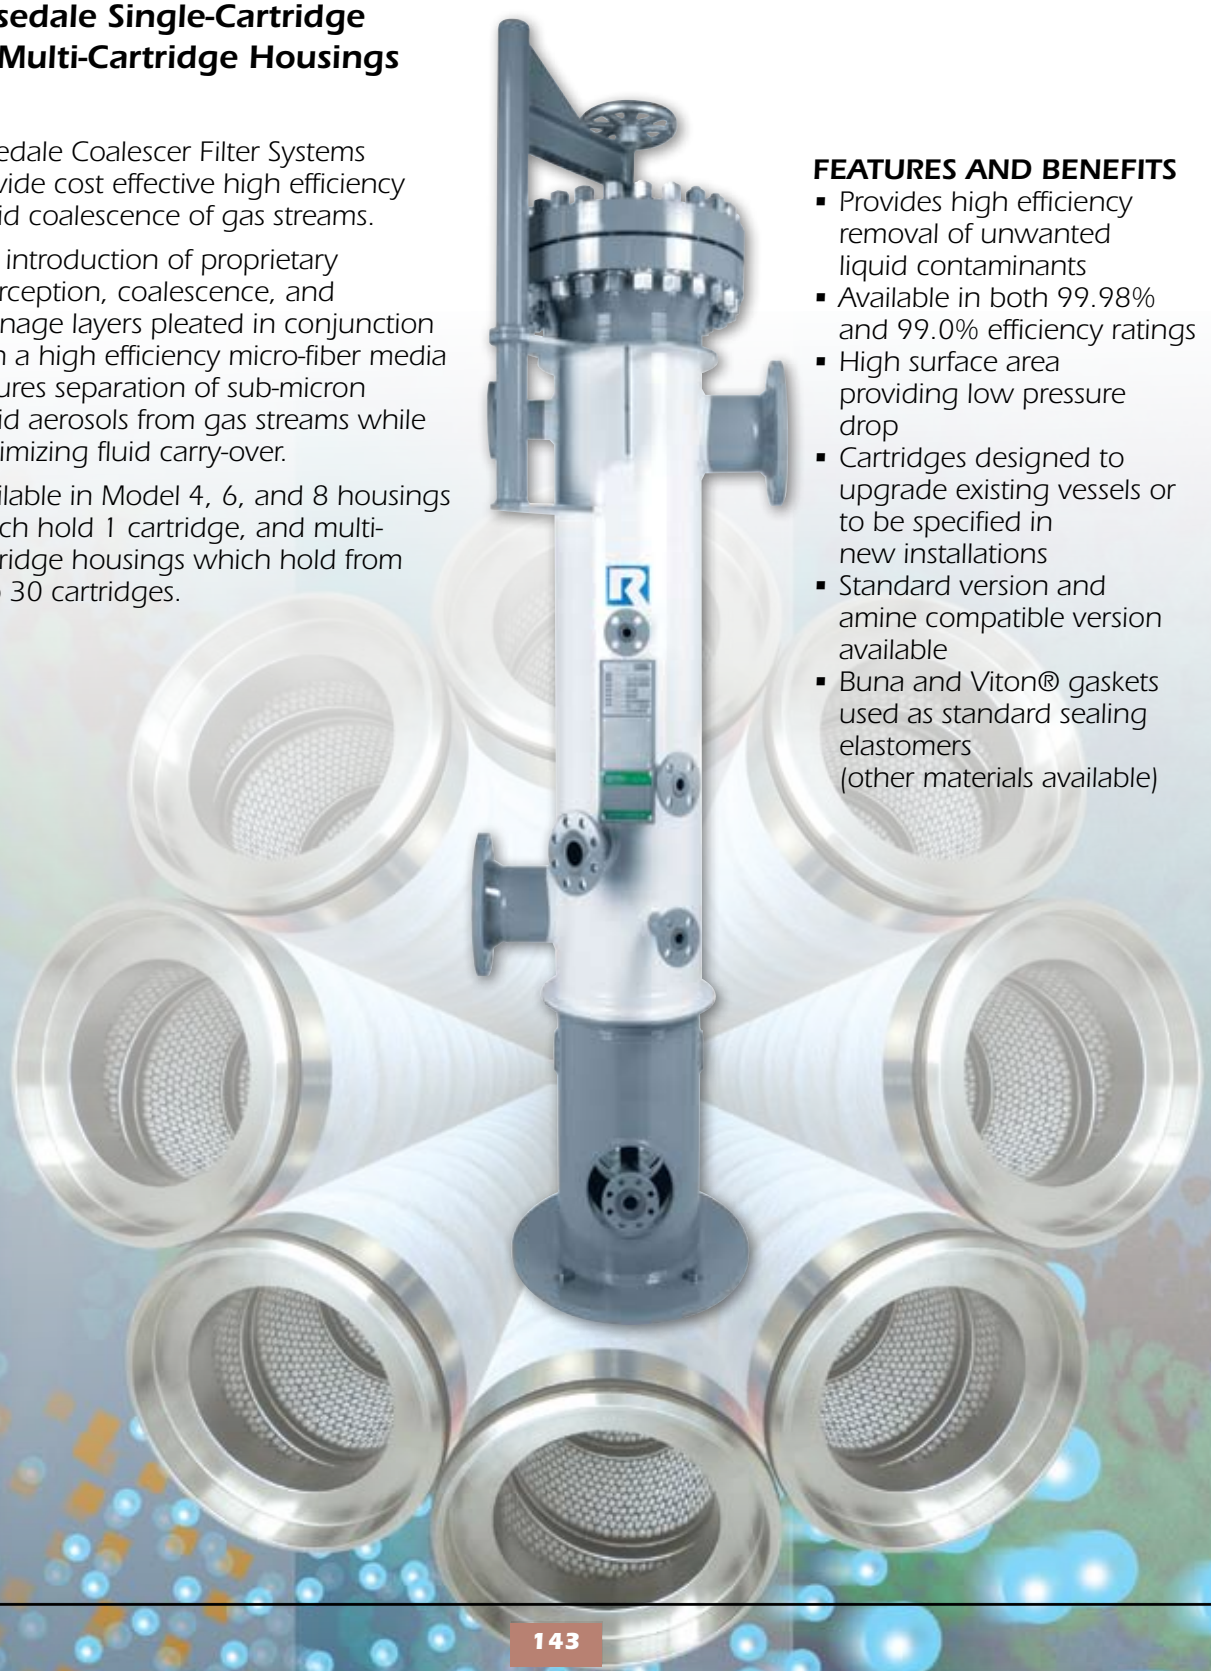
Coalescer Filter Systems

Rosedale Single-Cartridge or Multi-Cartridge Housings

Rosedale Coalescer Filter Systems provide cost effective high efficiency liquid coalescence of gas streams.

The introduction of proprietary interception, coalescence, and drainage layers pleated in conjunction with a high efficiency micro-fiber media ensures separation of sub-micron liquid aerosols from gas streams while minimizing fluid carry-over.

Available in Model 4, 6, and 8 housings which hold 1 cartridge, and multi-cartridge housings which hold from 1 to 30 cartridges.



FEATURES AND BENEFITS

- Provides high efficiency removal of unwanted liquid contaminants
- Available in both 99.98% and 99.0% efficiency ratings
- High surface area providing low pressure drop
- Cartridges designed to upgrade existing vessels or to be specified in new installations
- Standard version and amine compatible version available
- Buna and Viton® gaskets used as standard sealing elastomers (other materials available)

GENERAL HOUSING SPECIFICATIONS

Rosedale standard coalescer housings are available to accept 28", 40", and 60" cartridges. Larger multi-cartridge housings are also available.

- Model 4, 6, and 8 housings hold 1 cartridge
- Multi-cartridge housings hold from 1 to 30 cartridges
- Available in vertical or horizontal configurations
- Permanently piped housings
- Covers are bolted flange or QOC
- Carbon steel, or stainless steel (304 or 316) construction for housings
- All housings are electropolished to resist adhesion of dirt and scale
- ANSI class 150, 300, 600, 900, or 1500

GENERAL CARTRIDGE SPECIFICATIONS

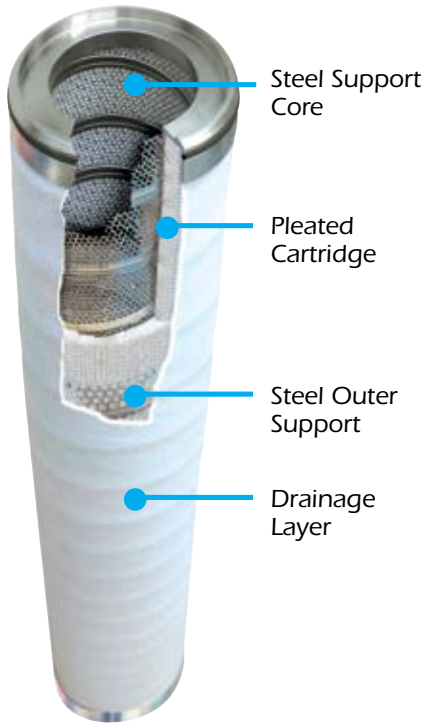
- 15 psi maximum pressure differential rating
- 5 to 9 pH range
- 150°–160°F maximum operating temperature
- Aluminum center tube
- Buna-N gaskets
- Aluminum end caps are standard on 6" diameter open end cartridges
- All 6" diameter cartridge end caps are bonded directly to the media with high strength epoxy or urethane
- 4" diameter cartridge end caps are molded polyester resin or injection molded

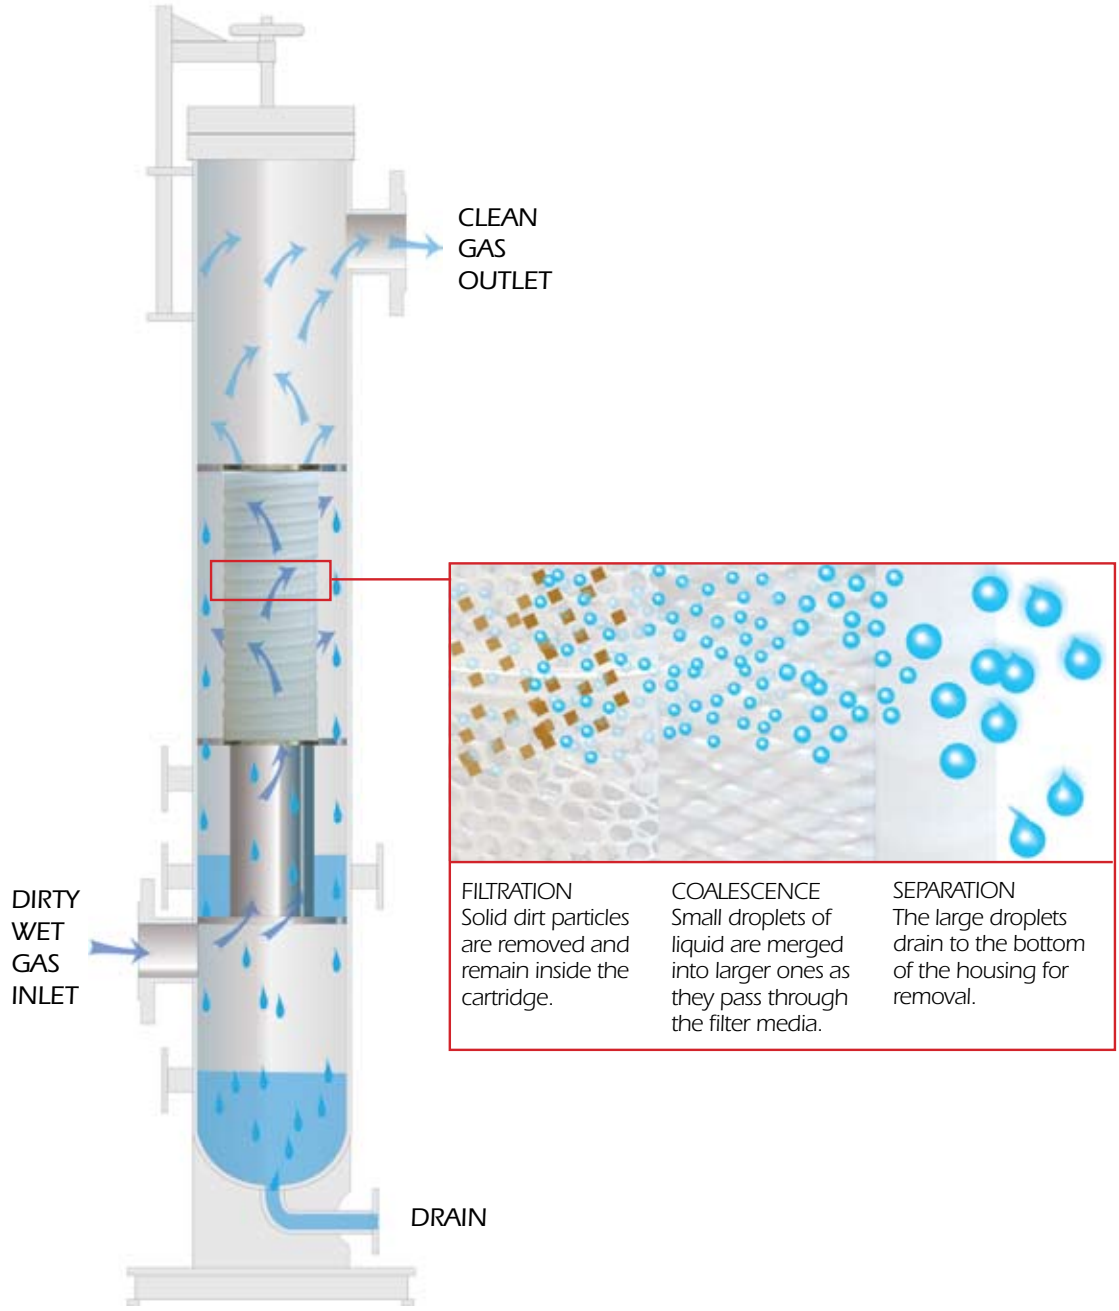
HOW COALESCER CARTRIDGES WORK

Tiny droplets of water contact and adhere to strands of fiberglass. Flow pushes the droplets along the strand until they reach an intersection of strands where they combine with other droplets (coalesce) into large drops.

These large drops are then carried to the outside surface of the cartridge. Having a higher specific gravity than the hydrocarbon fluid, they release and settle to the bottom of the vessel. The larger the drops, the faster and more efficiently they fall out. In general, particle removal efficiency increases with coalescing efficiency.

This is accomplished by employing a tighter, finer filtration media. Flow direction is from inside to outside of the cartridge. This minimizes surface velocity and helps prevent the water drops from breaking up and being carried downstream.





COMMON APPLICATIONS

- Amine plant feed gas and treated gas
- Suction and discharge of compressors
- Fuel gas purification
- Refine natural gas
- Remove water from shop air

COMMON LIQUID CONTAMINANTS

- Compressor lubrication oils, water, hydrocarbon condensates. Amines. Glycols. Solvents, Completion Fluids, Brine, and other liquid phase contaminates

FILTER BAG Design Details

Standard Filter Bag Types

MOLDED ROSEDALE TOP BAGS are stocked with polypropylene tops in sizes 1, 2, 3, 4, 8 & 9.

RING TOP BAGS are stocked in sizes 1, 2, 3, 4, 8, 9 & 12 with galvanized steel, rings.

HANDLES are standard on all bags.

ALL STANDARD STOCK BAGS have sewn construction.

FILTER BAG FINISH

Felt filter bags are supplied with a glazed finish to reduce fiber migration. Mesh filter bags are supplied with a plain finish as woven.

Microfiber filter bags have spunbonded covers to prevent fiber migration.

CONSTRUCTION

Standard filter bags are typically manufactured with a metal ring, either galvanized carbon steel or stainless steel, sewn in the top of the filter bag. Woven fabric handles are also sewn.

Another design incorporates a molded plastic top. These tops typically are polypropylene or polyester with molded lifting handles. Various types of tops are available to fit specific manufacturers' housings.

All Welded Construction

All seams and the collar are sonically welded, enhancing filtration quality, eliminating leaks and bypass that may have occurred with sewn seams.

Bag With Metal Ring Top

Bag With Molded Rosedale Top

10	55
25	65
50	70
100	110
200	200

Felt Filter Bag Micron Rating

For years filter bag manufacturers have used nominal ratings, i.e., about 50% efficiency for polyester and polypropylene felt filter bags. The table gives the micron ratings at about 95% efficiency.

Filter Bag Pressure Drop

The graphs give the clean pressure drop through a number 2 size bag for water, 1 CPS @ 68°F

To determine the pressure drop caused by the filter bag, follow these steps:

Step 1 Select the type of bag, micron rating and flow rate, determine the pressure drop for water, 1 cps @ 68°F, for a size #2 bag.

Step 2 Correct for bag size from the Bag Size Correction table at the right if the bag size is different than a #2 size.

Step 3 If the viscosity of the liquid is greater than 1 cps (water@ 68°F.),multiply the result from step 2 by the proper correction factor from the Viscosity Correction table at the right.

The value obtained in Step 3 is the clean pressure drop caused by the filter bag.

SUMMARY
For new applications, the clean pressure drop of the system, housing and bag should be 2.0 PSI or less. The lower the value is, the more contaminant a bag will hold. For applications with low dirt loading, this value can go to 3.0 PSI or more. Consult the factory for recommendations when the clean pressure drop of the system exceeds 3.0 PSI.

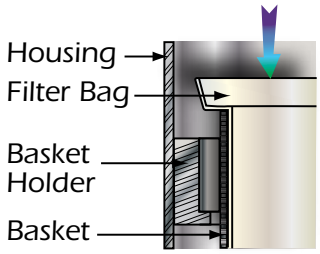
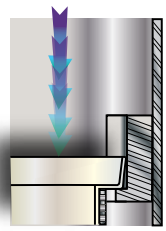
MOLDED ROSEDALE TOPS - RPO STYLE

Filter bags with molded Rosedale tops require no filter bag hold down devices. As the differential pressure in the application increases, the integrity of the seal improves. Polypropylene tops are standard with polyester optional for temperatures over 200°F, or for chemical capability.

THE MOLDED ROSEDALE TOP OFFERS THE BEST BAG-TO-HOUSING SEAL IN TODAY'S MARKETPLACE, IN ADDITION TO BEING THE EASIEST TO INSTALL AND REMOVE.



FILTER BAG WITH MOLDED ROSEDALE TOP JUST PRIOR TO INSTALLATION IN BASKET HOLDER



FILTER BAG WITH MOLDED ROSEDALE TOP INSTALLED IN HOUSING

	**FELT** filter bag materials are made from synthetic fibers in polypropylene or polyester. The proper combination of fiber diameters, weights and thickness results in an economical depth type filter media. Polypropylene and polyester bags are suppled with a glazed finish to reduce fiber migration. These bags have a nominal micron rating. Filter efficiency is about 50%.		**MULTIFILAMENT MESH** materials are offered in polyester and are woven from threads made of small fibers twisted together. Bags made of this material are low cost and considered disposable. They have lower efficiencies than the monofilament mesh. Filter efficiencies are about 80%.		**MONOFILAMENT MESH** is offered in nylon and is a woven material. Each thread is a single filament The openings are square,. They have excellent strength and are considered to be cleanable. Filter efficiency is 90% or more.	▪ Operates on the principle of surface filtration ▪ Wide range of micron ratings ▪ Reusable or disposable ▪ Non-fiber releasing ▪ Good efficiencies ▪ High contaminant quantities under correct conditions
	**MICROFIBER** filter bags provide high efficiency and high contaminant holding capacity at low ratings. Bags are available in polypropylene. Filter efficiency is 95% or more. MICROFIBER polypropylene filter bags also can remove oil from water and other liquids. Optimized designs are called "OIL REMOVAL BAGS".	
OTHER BAG TYPES AND DESIGNS

500 SERIES 3M TYPE multiple layer filter bags with microfiber filter layers and felt prefilter layers. Up to 5 layers of felt. See page 162.

DOUBLE & TRIPLE LAYER felt bags where the micron rating of the layers are designed to optimize service life.

SPECIAL SIZE & DESIGN bags are available in all materials and most micron ratings.

OIL REMOVAL BAGS require a special design to obtain to result in the largest surface area of fibers in a bag for maximum oil removal capacity. These are standard in micron ratings of 10 and 25. See page 166.

FILTER BAG HOLD-DOWNS

Adjustable filter bag hold-downs for Size #1 and #2 bags are available for side entry housings manufactured by:

Filter Specialists, Inc. / Micron Technologies / Krystil Klear / Strainrite / Other Side Entry Brands

Available in polypropylene, they provide additional positive filter bag hold-down capabilities for critical applications where necessary. It is suitable for ring top bags and bags with molded plastic tops. It is necessary for many bags with molded tops and ring bags if the bag manufacturer improperly designs and manufactures them.

A FILTER BAG HOLD-DOWN IS NOT REQUIRED WHEN USING FILTER BAGS WITH MOLDED ROSEDALE TOPS.

See page 215.

Rosedale Beta Bag® Filters

Filter bags for fine filtration requirements

After years of supplying filter bag products to the process industries, Rosedale has developed a new filter bag that meets even more exacting requirements, extending their use to finer process filtration and to hydraulic and lubricating fluid filtration. Rosedale Beta Bag® filter bags are made of a unique multilayer polyester felt, encased in spun-bonded nylon to prevent possible migration of bag material into the fluid stream. They're rated by the multi-pass method of filter performance evaluation, so that direct comparison can be made between Beta Bag® filters and cartridges of rigid construction using cellulose or synthetic elements, pleated or non-pleated. They compare very well:

- Because disposable Rosedale Beta Bags® are fitted into and supported by perforated-metal baskets, you need not be concerned with filter collapse, flow fatigue, or filter end-load problems.
- Beta Bags® can be installed and removed from their housings in a fraction of the time required to service rigid cellulose or synthetic element cartridge filters.
- Beta Bags® cost less than cylindrical filter cartridges, and they fold flat for more compact storage.
- Polyester/nylon bag materials are more resistant to the chemical additives in today's hydraulic and lubricant fluids (especially the high water base fluids), as well as the chemicals in Table IV.
- Prevention of possible media migration is assured by the spun nylon cover.

EXCELLENT FOR USE IN THE PROCESS, OIL AND GAS, HYDRAULIC AND LUBRICATION INDUSTRIES

The Multi-Pass Test Method For Evaluating Filter Element Performance

(OSU-F2, ISO 4572, ANSI B93.31-1973, NFPA T3.10.8.8-1973)

In this test procedure ACFTD (AC Fine Test Dust) is put into a reservoir ahead of a test filter. The test dust is comprised of many particle sizes (see Table II).

During the test, the flow rate through the filter is held constant, and test dust is added continuously. Contaminant not stopped by the filter is recirculated (hence the term "multi-pass").

At predetermined pressure drops across the filter, fluid samples are taken upstream and downstream of the filter. Using automatic particle counters (per ANSI B93.28-1973), the samples are analyzed for the number of particles per milliliter greater than a selected size. These counts are used to calculate "Beta ratios". **A Beta ratio is an accurate indication of how the filter performs throughout the life of the filter. The Beta ratio is an average filtration rating.**

A typical Beta ratio is expressed as B (Beta) 10 (particle size) = 16 (ratio), or B_{10} = 16 to 1 reduction of dirt at selected micron rating. Table I gives the Beta ratios for the three Beta Bag® micron-rated bag materials.

Table I

Rosedale Beta Bag® Beta Ratios

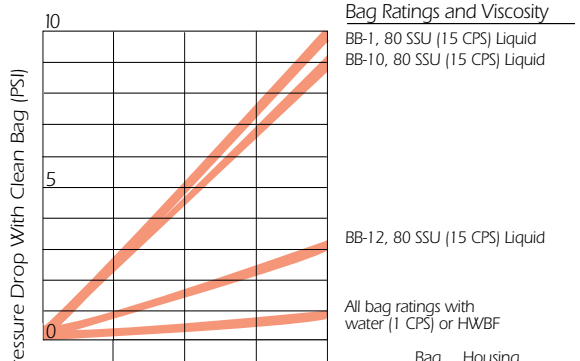
Multi-pass tests are at 20 gpm flow, with terminal pressure drop of 15 psi. Standard sewn bags were tested, in standard housings.

Beta Bag® Micron Rating (nominal)	Mean ACFTD retention size Equals 50% filter efficiency (nominal rating)	Effective ACFTD retention size Equals 95% filter efficiency	Maximum ACFTD retention size Equals 98.7% filter efficiency (absolute rating)
BB-1	B_1 = 2 (1um nominal)	B_4 = 20 (4 um)	B_8 = 75 (8 um absolute)
BB-10	B_{10} = 2 (10 um nominal)	B_{16} = 20 (16 um)	B_{20} = 75 (20 um absolute)
BB-12	B_{12} = 2 (12 um nominal)	B_{37} = 20 (37 um)	B_{47} = 75 (47 um absolute)

Table II

ACFTD Composition

Range of Particle sizes (micrometers)	Distribution by weight (percent)
0-5	39
5-10	18
10-20	16
20-40	18
40-80	9



Flow Rates (gpm)					Bag Sizes	Housing Sizes
5	10	15	20	No.3	4
10	20	30	40	No.4	4
13	26	39	52	No. 7	6
20	40	60	80	No. 8	6
20	40	60	80	No.1	8
44	88	132	176	No. 2	8

Selecting A Rosedale Beta Bag®

1. Determine the micron rating needed. For hydraulic fluids, the BB-1-rated bags should be considered for high-pressure circuits, the BB-10 for common service, and the BB-12 for low-pressure service. For process liquids, the BB-1 rated bags are recommended for use as pre-filters for membrane filters. Automotive clear coatings are being successfully filtered with BB-10 and BB-12 rated bags.
2. The Pressure Drop Versus Flow Chart shows specific flow rates achieved through various sizes of Beta Bags® using 32 (water) and 80 SSU viscosity liquids. Pressure drops can be read directly for these viscosity levels.
3. If your liquid viscosity level is higher than 80 SSU, you can use a correction factor to determine what your pressure drop will actually be.
4. Using Table III find your actual SSU level and multiply the pressure drop of interest to you by the correction factor shown. You can interpolate easily since the relationship is linear. For example, a viscosity of 280 SSU would have a correction factor of 3.5.
5. Example: A clean BB-1 rated No. 8 size Beta Bag® at 20 gpm will impose a pressure drop of 2.7 psi (with 80 SSU liquid). For use with 320 SSU oil, the pressure drop will be 2.7 times 4 (the correction factor), or 10.8 psi.

Table III

Viscosity SSU	Viscosity CPS	Correction Factor
80	15	1
160	35	2
240	55	3
320	70	4
400	90	5

Table IV

Compatibility With

Bag Materials (Fiber)	Organic Solvents	Animal Vegetable & Petro Oils	Micro-organisms	Alkalies	Organic Acids	Oxidizing Agents	Mineral Acids	Temperature Limitations (max. deg F)
Polyester	Excellent	Excellent	Excellent	Good	Good	Good	Good	325
Nylon	Excellent	Excellent	Excellent	Good	Fair	Poor	Poor	325

Design Details

All Beta Bags® have a metal retaining ring sewn in their openings. Standard ring material is carbon steel, with a 316 stainless steel optional. They hold the bag in place and prevent fluid bypassing the element.

Heavy-duty handles, sewn to the reinforced bag lip, are a standard feature. They make bag removal faster and easier.

Graded Density

Depth filtration for enhanced clarity- For filtration to 1.0 micron

Rosedale's Graded Density (GD) Fat Bags® bags have approximately four times the dirt holding capacity of standard bags at equivalent filtration levels. These bags have 9 layers of material, each with 4.4 sq. ft. of surface area. GD bags are easier to install and remove, require less room in storage and disposal, and prevent the contaminant wash off downstream associated with cartridges.

They produce excellent results when used as a pre-filter for membrane filtration. They will retain a large quantity of contaminant that will unnecessarily clog the membrane. The bags are available in either all polyester or all polypropylene construction. **Polyester should be used** where oil adsorption is not desirable or where higher temperatures are required.

Filtration Level

These bags have been tested by an independent laboratory to determine the filtration efficiency of the media used in each of the filter bags. The efficiencies for polyester and polypropylene are identical.

Model Number	523	525	527	529
EFFICIENCY	MICRON RATING			
95.0%	1.0	3.0	8.0	19.0
99.0%	2.0	5.0	19.0	25.0

The test was conducted using AC Fine Test Dirt interfaced into clean water at 20 GPM.

Dirt Carrying Capacity

Tests that were conducted using a size 2 bag and AC fine test dirt at 20 GPM, show dirt holding capacities for the following filtration ratings (at 20 psi).

Micron Rating (95%)	Model	Dirt Holding Capacity (in grams)
1.0	523	267
3.0	525	296
8.0	527	573
19.00	529	870

Pressure drop at 50 gpm flow (water) and specified micron rating using a Rosedale Model 8 (8-30) filter.

Design Details

Graded Density Bags have a 304 stainless steel retaining ring sewn in their opening. Heavy-duty handles, sewn to the reinforced bag lip, are a standard feature. They make bag removal faster and easier.

The bags are sewn, then turned inside out to avoid leakage through the threads. They are also made with sewn, fully-shaped bottoms to enhance the pressure capacities of the bags.

There are two sizes available. Size 1 is 7 inches by 16 inches. Size 2 is 7 inches by 32 inches.

X-TEND Filter Bags Offer Additional Surface Area for Increased Filtration Efficiency

Sonically Welded Seams and Integral Plastic Collar Further Increase Efficiency

Rosedale offers the new X-TEND filter bag as a balance between increased efficiency and capacity versus cost. It offers about twice the surface area of a standard bag. The integral hard plastic collar makes installation and disposal easier, as there is no metal to worry about. These bags do require the use of a special cone basket. It supports the inner layer, ensuring the full surface area is utilized, maintaining optimum filtration.

As an added feature, all seams and the collar are sonically welded, greatly enhancing filtration quality, reducing or eliminating leaks and bypass that may have occurred with sewn seams. The X-TEND bag is about twice the length of a standard bag, and you simply tuck the bottom of the bag back up into the main cylinder of the element. When the bottom of the bag reaches the neck of the collar, the bag should now be the size of a standard bag, and fit most housings.

Filtration Level

These bags have been tested by an independent laboratory to determine the filtration efficiency of the media used in each of the filter bags. The efficiencies for polyester and polypropylene are identical.

Efficiency	Micron Rating									
95%	1	3	8	19	35	48	55	65	70	90	110

Design Details

These bags have a plastic collar sonically welded into their opening. This collar has integral handles as a standard feature. They make removal faster and easier.

The standard felt finish is glazed. The micro fiber bags are sonically welded, then turned inside out, increasing the protection against leakage through the seam.

These bags are available in standard bag sizes.

Vertical Pleated Bag

Increases surface area by 50%

With proprietary advances in pleat profile and rigidity, graded density material, and utilized surface area, our vertical pleated bag outperforms standard bags at a similar price.

Features

- Fits all standard #1 and #2 size bag housings
- Protects final filter media from premature blinding, and increases filter life
- Fewer filter change outs reduces cost
- Reduced filter bag disposal cost
- Longer, uninterrupted processing/run times

Applications

- Glycols
- Adhesives
- Inks
- Amine
- Paints/Coatings
- Beverages
- Plating Solutions
- Coolants
- Resins
- Cutting Fluids
- Petro-Chemicals
- Cooling Towers

The OA All Polypropylene Oil Removal Filter Bag

The perfect answer for removing trace oil and grease from an industrial stream of aqueous-based fluids

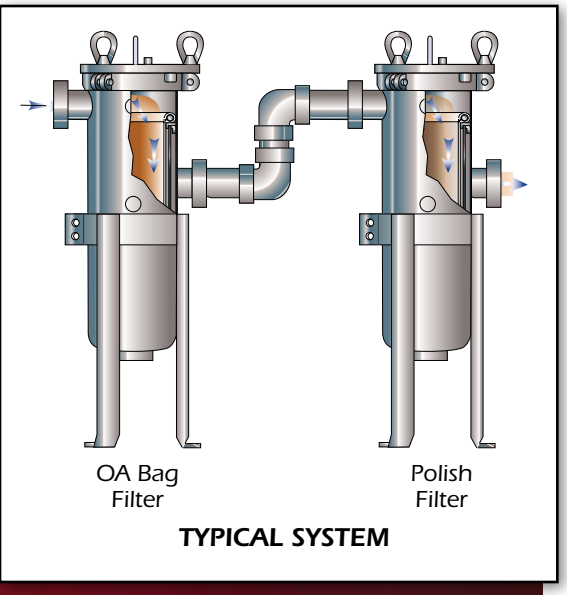
Bag can be designed to remove from 2 to 161b. of oil by increasing layers or adding strips which add to the surface area and increase efficiency, structural strength, and filter life.

OA Bags are designed with a cover for the prevention of fiber migration and include reinforced lift handles to facilitate its removal, If waste storage is a problem, the OA Bag can be completely disposed of by Incineration.

The Ideal oil removal system is the OA bag as a pre-filter and a high-efficiency bag as the final polish filter.

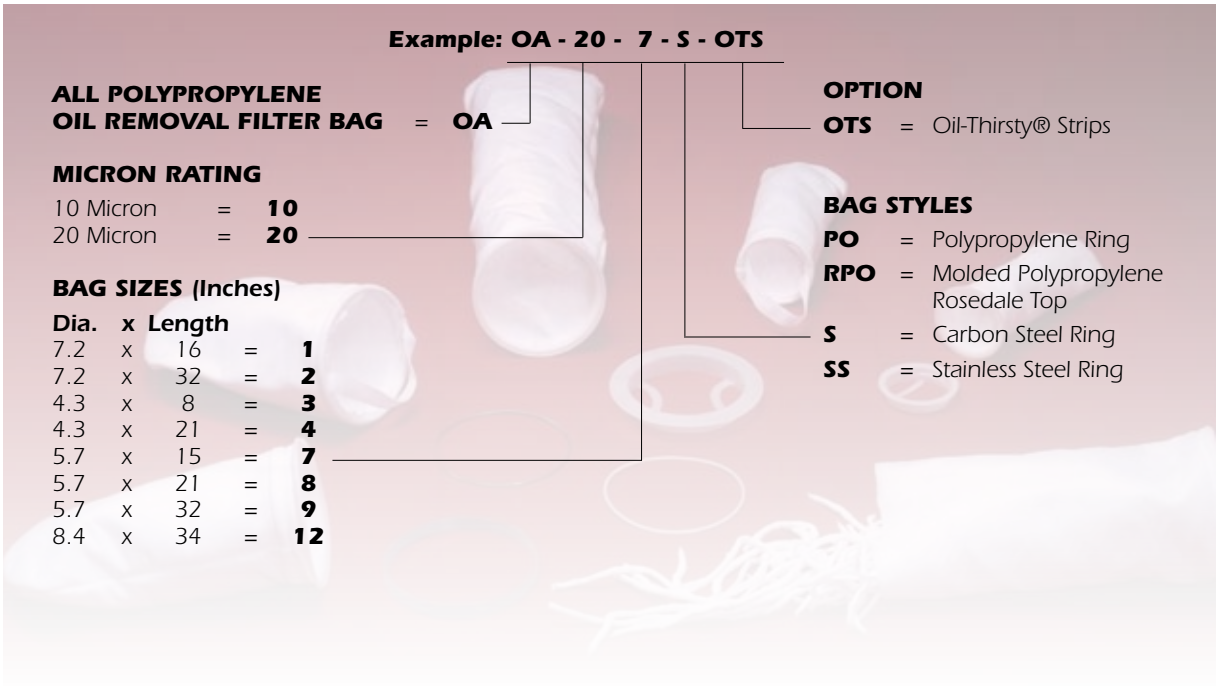
Features

- Micron rated and able to remove oil from aqueous based fluids.
- Standard with reinforced handles for easy removal.
- Maximum oil absorption with minimum pressure drop.



TYPICAL SYSTEM

How To Order Build an ordering code as shown in the example



Series OE Oil/Water Separation Cartridge

Oil Eliminator cartridges utilize media that can economically reduce hydrocarbon contamination in aqueous solutions. Our radial flow designs provide the largest possible surface area, reducing the media bed depth. The OE Series is capable of removing very high concentrations of free oil, dispersed oil, as well as surfactant based emulsions, and dissolved hydrocarbons to non-detectable levels.

These cartridges can be used as stand-alone oil water separators, or to enhance or protect other systems.

3 Styles

The Oil Eliminator OE™
Our top performing OE cartridge capable of breaking the IMO 107(49) surfactant based emulsion in a single pass. The special patented non swelling organic clay allows the cartridge to be filled with 100% active oil absorbing media, providing greater oil holding capacity.

The ECO™
The ECO is our GREEN cartridge, made using a uniquely processed post consumer recycled media. The ECO has the ability to remove soluble oils from water in a single pass. It can be used alone or following our standard Oil Eliminator™ cartridge to bring the effluent down to non-detect levels. US patent pending No. 13/051,872

The Oil Eliminator NF™
The OENF cartridge uses a combination of adsorbing media and nano-technology to remove high concentrations of free and oil emulsions. This high area, pleated cartridges can provide particle removal of 0.2 u @ 99.9% efficiency. The OENF's adsorptive characteristics remove negatively charged particles such as bacteria, organic contaminates, heavy metals such as copper, iron, lead, and tin. US patent pending No. 12/582,684

OE 650..... 3 l

How To Order

Build an ordering code as shown in the example

Features

- Meet governmental regulations
- Reduced maintenance due to fouling
- Can be incinerated
- Minimal pressure drop
- Withstands harsh environments
- Industry standard sizes and end caps
- Operating temperature to 65°C
- Withstands high Dp up to 5 bar
- Typically removes better than 99% in a single pass

Applications

- Commercial bilge and ballast water
- Post oil/water separator polishing
- Oil field produced water
- Pipeline maintenance activities
- Hydraulic tramp oil removal
- Parts washing and plating baths
- Compressor condensates
- Boiler blow down
- Membrane pretreatment
- GAC pretreatment
- Pump sump discharge

Rosedale High Flow Elements

Designed specifically for use with our High Flow Housing Systems

The housings are available in a variety of sizes to accommodate from 1 to 31 filter elements in 40-inch and 60-inch lengths.

- Flow rates up to 400 gpm per element
- Removal Ratings (microns) 0.5, 1, 5, 10, 20, 40, 70 @ Beta 500 (99.8% efficiency)
- Maximum Operating Temperature 160 °F (71 °C)
- Maximum Differential Pressure 50 psid @ 68°F (3.4 bar @ 20°C)
- Recommended Change-out Differential Pressure 35 psid @ 68°F (2.4 bar @ 20°C)
- Bag restrainer expands bag fully during filtration.

The High Flow Housings

High Flow housings can accommodate from 1 to 31 filter elements. Larger housings are available upon request. The horizontal style maximizes ease of operation, while minimizing the system's footprint.

- Horizontal mounting configuration
- Hinged cover for easy element change-outs
- Standard pressure / temperature ratings to 300 psig and 250 °F
- Available in Carbon Steel, 304, or 316 Stainless Steel
- 40" and 60" element lengths
- ASME Code design

NEW SurfaceMaxx Series Bag-Sized Cartridges

High-performance cartridge provides up to 12 times more dirt-holding capacity

The new Rosedale filter cartridge traps contaminants inside, preventing "WASHOFF" when removing spent or dirty cartridges. They provide larger surface areas and greater dirt holding capacities than standard bags. They are the ideal solution when frequent servicing of filters is a problem.

Construction

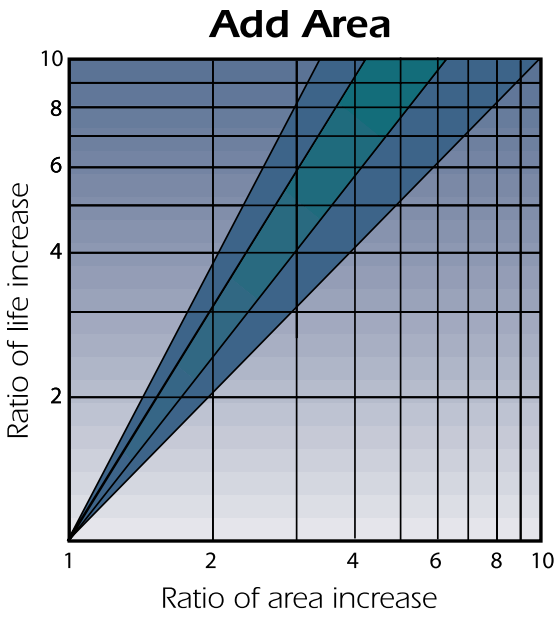
Rosedale bag-sized pleated cartridges are unique. Twenty square feet of high efficiency polyester material pleated in a supported construction. This ensures flow cannot be pinched off. It also greatly strengthens the overall integrity of the element. The top sealing ring and cartridge bottom are made of polyester.

Applications

Fluid processing: Solvents, acids, chemicals, hydrocarbons, water and other fluids used in refinery, chemical and petrochemical processing.

Features

- Available in standard bag size 2
- Low pressure drop



Product Specifications

Filter Composition- 100% Polyester

Surface Area: 20 ft^2

Nominal Size: 7"D x 26"L (178 x 660 mm)

Recommended change out differential pressure: 15 PSID

PL Series Bag-Sized Cartridges

Absolute-rated units provide up to 12 times more dirt-holding capacity

Rosedale has combined the best features of filter bags and cartridges into one single unit. Like bags, these bag-sized pleated cartridges are easy to handle and trap contaminant inside, preventing "WASH OFF" when removing spent or dirty cartridges. Like cartridge elements, they provide larger surface areas and greater dirt-holding capacities than standard bags. They are the ideal solution when frequent servicing of filters is a problem.

Construction

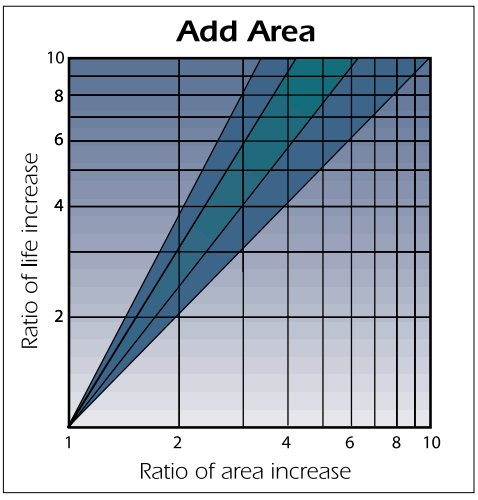
Rosedale bag-sized pleated cartridges are unique. Twenty-five* square feet of high efficiency material is sandwiched between two flow-enhancing, coarse-mesh screens, and then pleated in a supported construction. This supported pleat construction ensures flow cannot be pinched off. It also greatly strengthens the overall integrity of the element. The seams in these units are ultrasonically welded, not sewn, to prevent leakage or contamination bypass. The top sealing ring and cartridge bottom, made of solid molded polypropylene, are sonically welded to the pleated cylinder.

Features

- Eleven micron retention ratings from 1 to 110 at 95% efficiency, are available
- Three different top sealing ring designs - one to fit your needs
- Available in standard bag sizes 1 and 2, to fit housings 8-15 and 8-30
- Low pressure drop

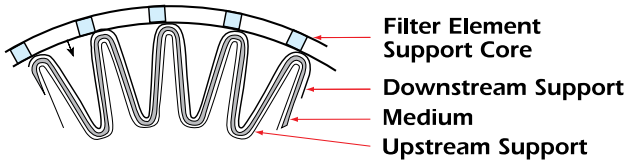
*For Size 2 cartridge, Size 1 cartridge has 13 square feet of material.

R1 Design - Flared
RPO Rosedale Top (standard)

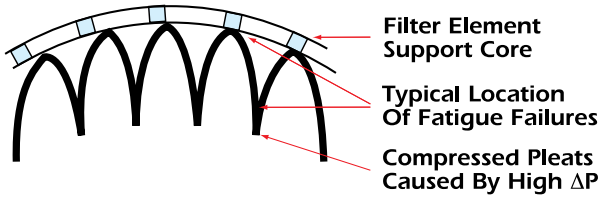


Supported Medium Means No Breakthrough

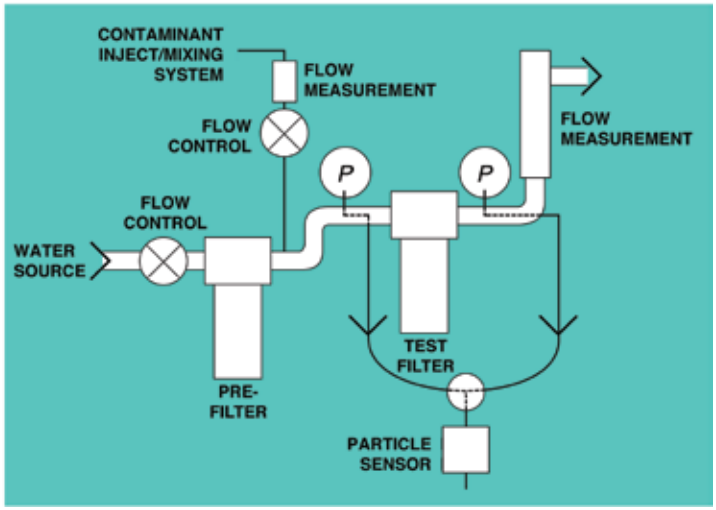
A. Section of Supported Filter Element



B. Unsupported Element Section



Cyclic flow, cyclic pressures, and increasing ΔP as the element loads with dirt cause unsupported medium to crack through and become a "non-filter."



Schematic showing single-pass efficiency test

Materials

These elements use our unique high-efficiency microfiber material. Polyester or polypropylene microfibers and standard fibers are variably calendered to produce a single layer of our high-efficiency microfiber felt. This unique construction provides filtration to 1 micron at 95% efficiency. A real rating for the real world, consistently giving the same level or performance from batch to batch.

Greater Capacity Means Longer Life

FILTRATION LEVEL

These elements have been tested using the Single-Pass Efficiency Test (see diagram) using water and AC Fine Test Dust. Water is passed through an initial pre-filter (at 0.45 µ), after which contaminant is injected into the water line. An automatic particle counter analyzes the number of particles per milliliter greater than a selected size, before the water enters the filter. The water then passes through the test filter, and the effluent is analyzed for the number of those same-size particles. The number of particles removed provides the efficiency rating. For example, if after the single pass, 95 percent of the particles are removed, then the filter is 95 percent efficient at the specified micron rating.

FILTRATION EFFICIENCY

Using the single pass efficiency test, we've determined the following efficiency ratings for our pleated cartridges. Real ratings are consistently accurate and reliable, time and time again.

MICROFIBER GRADES

Model Number	PL-PEMF-1.0 PL-POMF-1.0	PL-PEMF-3.0 PL-POMF-3.0	PL-PEMF-8.0 PL-POMF-8.0	PL-PEMF-19.0 PL-POMF-19.0
EFFICIENCY	**MICRON RATING**			
95%	**1**	**3.0**	**8.0**	**19.0**
99%	**2**	**5.0**	**19.0**	**25.0**

RECOMMENDED MAXIMUM FLOW RATE (GPM / ELEMENT) AT 1.0 PSID

Element Size	Model Number PL-PEMF 1-19 PL-POMF 1-19	Model Number PL-PE 35-110 PL-PO 35-110	Viscosity
P1	50 GPM	75 GPM	1 CST
P2	100 GPM	150 GPM	1 CST

STANDARD FIBER GRADES

Model Number	PL-PE-35.0 PL-PO-35.0	PL-PE-48.0 PL-PO-48.0	PL-PE-55.0 PL-PO-55.0	PL-PE-65.0 PL-PO-65.0	PL-PE-70.0 PL-PO-70.0	PL-PE-90.0 PL-PO-90.0	PL-PE-110.0 PL-PO-110.0
EFFICIENCY	**MICRON RATING**						
95%	**35.0**	**48.0**	**55.0**	**65.0**	**70.0**	**90.0**	**110.0**

If fluids with viscosities greater than 1 CST are used, divide the flow by the correction factor obtained below.

If your viscosity is not listed, choose the next highest viscosity from the chart and use that correction factor.

Fluid Viscosity SSU	Fluid Viscosity CPS	Correction Factor
80	15	1.2
160	35	2
240	55	3
320	70	4
400	90	5
480	110	6
560	130	7
640	150	8
720	180	9
800	260	10

For example, to filter a fluid having a viscosity of 55 cps using a PL-PEMF P2 element the equation is as follows:

$$\text{Corrected Flow Rate} = \frac{\text{Max Flow Rate}}{\text{Correction Factor}} = \frac{100}{3} = 33 \text{ GPM}$$

Low-Cost, High-Capacity Disposable Bag-Sized Pleated Cartridges

For Models 8, LCO, NCO, and Multi-Bag Filters

These new elements from Rosedale are easily installed in our standard housings. The PLRICU cellulose filter provides 10 TIMES the surface area of standard filter bags, and the PLRIPF polyester felt provides 6 TIMES the area. Also available; a pleated element insert and a self contained cartridge/basket combination. These low cost dirt gluttons provide superb capacity with filtration performance as high as 99% efficiency.

Features

- Available with or without metal cage
- Seals in a standard strainer basket
- Over 50 square feet of surface area
- Beta 100 (99%) Retention Levels
- Longer Element Life provides improved system efficiency

Benefits

- Fewer Change-outs required
- Less Downtime
- Improved quality due to improved retention ratings
- Lower Maintenance and Labor Costs
- Reduced Operator Exposure
- Recyclable with no metal (optional)

Ideal for Coolants

PLRICU- Cellulose Filter

Platinum Series ABSOLUTE-RATED Bag-Sized Cartridges

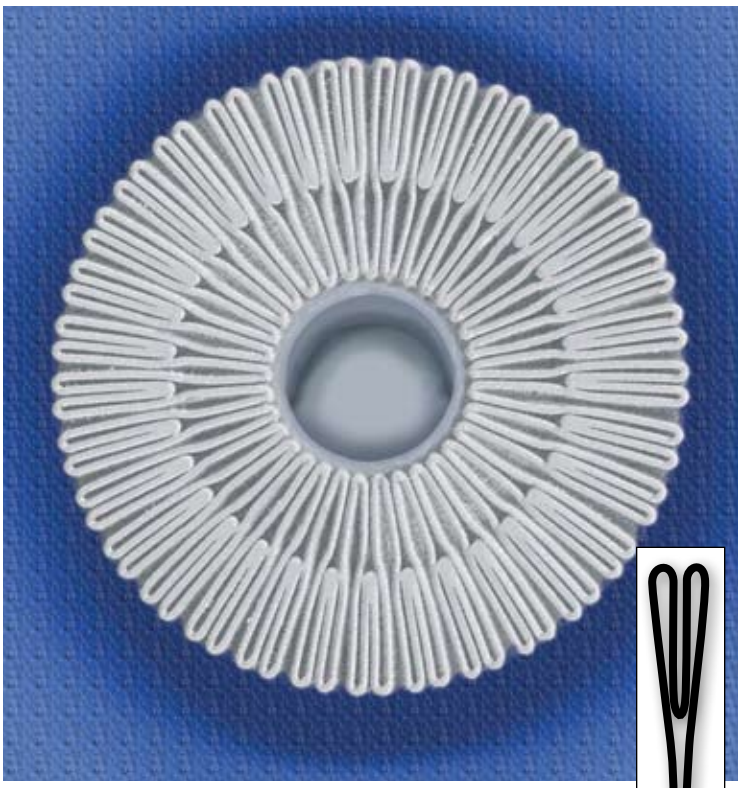
Maximum dirt-holding capacity

These absolute-rated filter cartridges offer maximum dirt holding capacity coupled with micron retention ratings to 0.5 at 99.98% efficiency.

These elements are manufactured in a unique "Y" pleat arrangement that optimizes its physical size and maximizes effective surface area. A low fluid flux rate maximizes dirt containment. This means element life is extended and productivity is increased, resulting in fewer cartridge change-outs, less labor, and lower replacement costs.

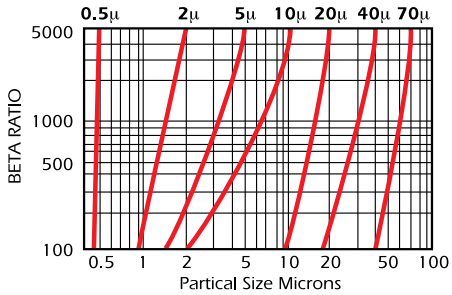
Design Details

This design uses only the highest quality materials and most advanced manufacturing processes. The end caps are heat sealed for high efficiency performance. The o-ring seal insures sealing and eliminates bypass.



The "Y" pleat maximizes effective surface area.

Rosedale BETA Curves



The Beta Ratio (ß) at a given particle size can be correlated to the filter efficiency at that particle size according to the following formula:

Filter Efficiency (%) = [(b-1)/b] x 100%

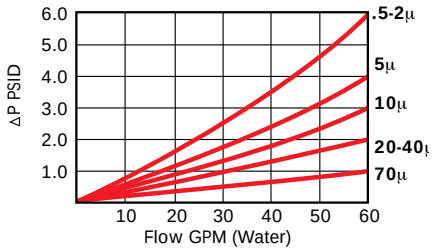
Beta Ratio (ß)	100	1000	5000
Filter Efficiency (%)	99.00	99.90	99.98

Each filter element will have a different Beta Ratio for every specified particle size. The determination of a variety of Beta values for the same filter provides a filter efficiency profile commonly referred to as a Beta Curve.

Platinum 500

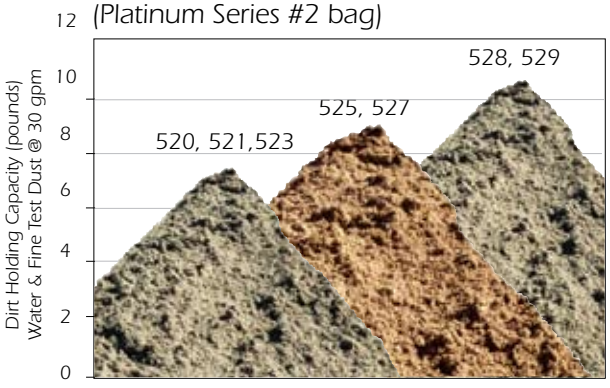
- 68 sq. ft. of surface area maximum
- 12 lbs. (approx.) of dirt carrying capacity
- Rated 0.5 micron to 70 micron @ ß5000 or 99.98% efficiency
- Flow rates to 50 gpm.
- 6.25-inch diameter and 24-inch length
- Fits into Rosedale Model 8-30, Multiple-bag housings, Polypropylene, and Multi-cartridge housings

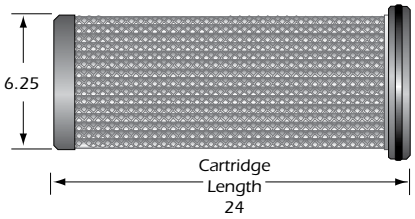
Flow Rate Vs. ΔP



Dirt Holding Capacity

(Platinum Series #2 bag)

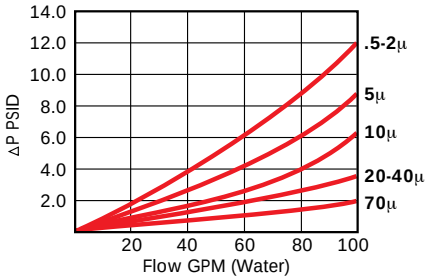




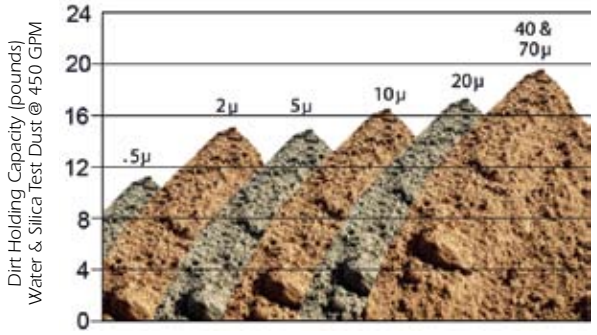
Platinum 700

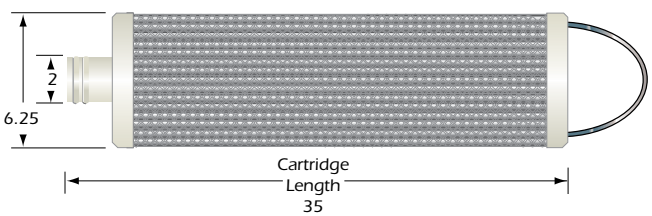
- 100 sq. ft. of surface area maximum
- 20 lbs. (approx.) of dirt carrying capacity
- Rated 0.5 micron to 70 micron @ ß5000 or 99.98% efficiency
- Flow rates to 100 gpm.
- 6.25-inch diameter and 35-inch length
- Fits into Rosedale Model 8135, Polypropylene, and Multi-cartridge housings

Flow Rate Vs. ΔP



Dirt Holding Capacity



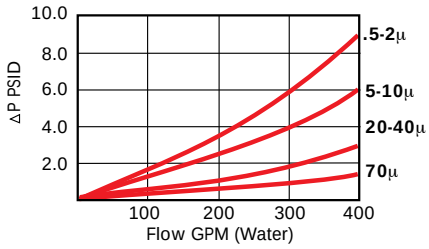


See Platinum Filter Housings on page 70

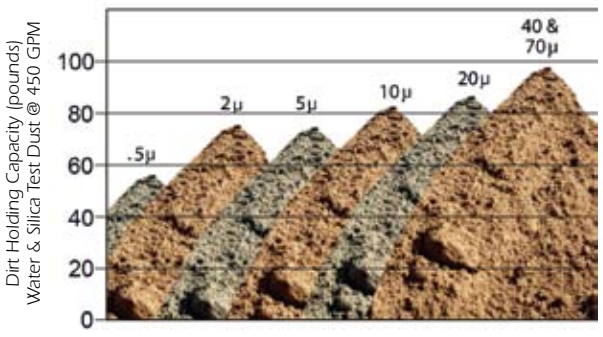
Platinum 900

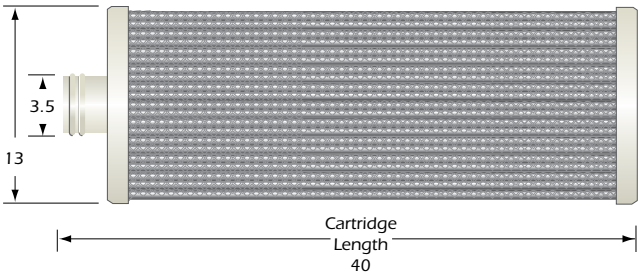
- 400 sq. ft. of surface area maximum
- 100 lbs. (approx.) of dirt carrying capacity
- Rated 0.5 micron to 70 micron @ ß5000 or 99.98% efficiency
- Flow rates to 400 gpm
- 13-inch diameter and 40-inch length
- Rosedale housings can hold multiple cartridge elements

Flow Rate Vs. ΔP



Dirt Holding Capacity





Platinum 2040

- 1150 sq. ft. of surface area maximum
- 250 lbs. (approx.) of dirt carrying capacity
- Rated 0.5 micron to 70 micron @ ß5000 or 99.98% efficiency
- Flow rates to 600 gpm
- 20-inch diameter and 40-inch length
- Rosedale housings can hold 1 element

Flow Rate Vs. ΔP

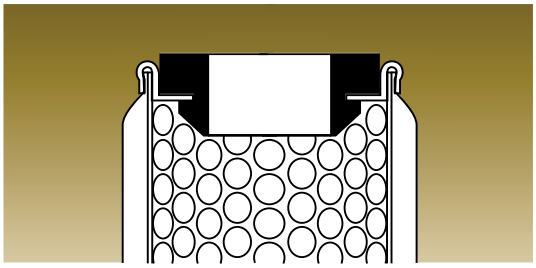
Stainless Steel Filter Cartridges

Overcome the temperature and compatibility limitations of fabric or synthetic fiber cartridges by replacing them with these stainless steel wire cloth elements. They're good up to 500°F instead of the usual 250°F, and they are unaffected by most caustic fluids.

Made entirely of 304 or 316 stainless steel, they are cleanable and reusable, and can withstand differential pressures up to 60 psi. (500 psid units are also available.) You can choose particle retention ratings as fine as 5 microns. (For nomograph see page 192).

Element surfaces can be plain cylindrical, or pleated to increase surface area. Pleated units rated 100 microns or finer have an underlying support layer of coarser mesh to prevent pleat collapse. Fabrication is by welding and crimping; no silver brazing or epoxy bonding is used.

A "bubble pointing" test can be done to certify that no openings larger than the specified pore size exist in product joints or seams. Ask for more information about this.



Rosedale seals are specially shaped to hold in place mechanically, like a grommet. There's little chance they will be dislodged and lost in handling. They are made in different thicknesses to provide seven different standard overall element lengths.

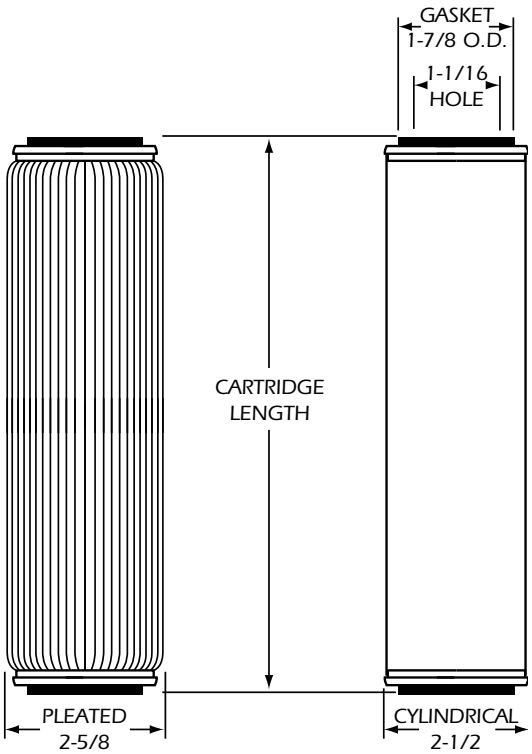
Dimensions (IN)



Pleat Protectors

Pleat protectors prevent accidental denting of pleat forms that reduce filter area. Made of stainless steel with 1/4-in. dia. perforations, they are held in place by bending tabs at the top and bottom. When ordering give nominal length (10, 20, or 30 inches) and material (304 or 316 stainless steel).

POROPLATE® Filter Elements

Superior Filtration and Longer Life

The Poroplate line of Sintered Stainless Steel filter elements provide longer life and superior filtration results. They utilize multiple layers of woven wire mesh, sintered into a robust high-strength media. This media is then formed into a filter element, and welded to provide strength and stability. The resulting element traps contaminant on the outside or up-stream surface. The inner or down-stream layers (flow is from outside in) have an open pore construction to facilitate high flow rates and excellent backflushing. During the Backwash Cycle, virtually all contaminant is removed from the element, and is then ready for reuse.

These Poroplate filter elements meet demanding application requirements in many industries, such as Chemical Processing, Industrial Gas Flow, Polymer Production, Food & Beverage Processing, and in Power Generation. The longer life, higher dirt-holding capacity, and easy cleaning and reuse through backflushing, make these elements ideal in applications where reduced operator exposure is desired or required.

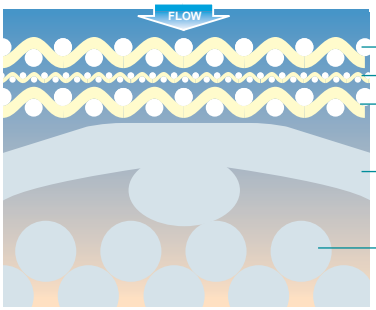
They are available in micron retention ratings from 3 to 150. The elements use industry standard sizes of 2-3/8 inch diameter in 10-inch, 20-inch, 30-inch and 40-inch lengths. Stainless 316L is standard, but other steels may be custom ordered, consult factory.

Features

- No media migration
- 316L Stainless Steel construction
- Resists corrosion
- Easily cleaned/backflushed
- Longer life
- Reduced labor
- Reduced operator exposure
- Reduced disposal costs
- Custom sizes, designs and construction

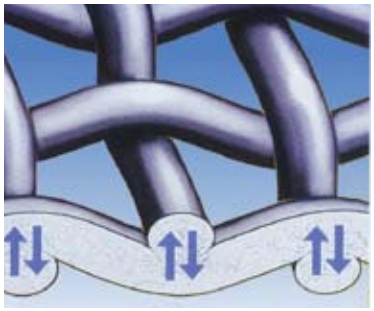
Note: Poroplate is a registered trademark of Purolator

Downstream Support Layers provide reduced differential pressure through open flow channels, as well as higher flow rates and longer filtration cycles. These layers greatly encourage backflushing, keeping the element on line longer.



Protective Guard Layer
Filter mesh for precise particle size control
Flow distribution layer

Two coarse support layers for strength and rigidity



These elements are sintered at over 1100°C in a controlled atmosphere furnace. This process fuses metal molecules of the different layers at contact points into a new, completely integrated structure.

Rosedale's Absolute Pleated Cartridges

High efficiency cartridges–
Long service life

Rosedale filter cartridges provide efficient solids removal in liquid systems where series filtration is not required. Absolute Ratings range from 0.5 to 70 microns.

Each cartridge has pleated, fixed pore media to maximize surface area, prevent particle unloading, and fiber migration. Media selections include cellulose, fiberglass, polyester, and polypropylene.

The wide variety of media, filter sizes, and end cap configurations provide customers with the preferred cartridge for their specific application.

Superior construction materials and quality control techniques ensure that our filter cartridges will provide quality filtration, even in harsh operating conditions.

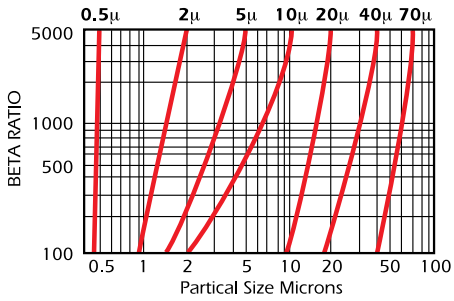
Rosedale Beta Curves



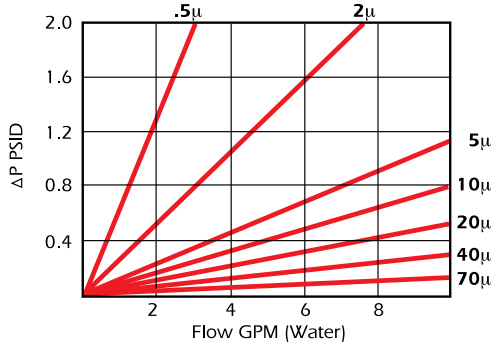
The Beta Ratio (ß) at a given particle size can be correlated to the filter efficiency at that particle size according to the following formula:

Filter Efficiency (%) = [(b-1)/b] x 100%

Beta Ratio (ß)	100	1000	5000
Filter Efficiency (%)	99.00	99.90	99.98

Each filter element will have a different Beta Ratio for every specified particle size. The determination of a variety of Beta values for the same filter provides a filter efficiency profile commonly referred to as a Beta Curve.

Flow Rate Vs. ΔP



Flow rate is per single 10-inch element. For other liquid's, multiply the ΔP by the fluid's viscosity in centipoise. For longer cartridges, divide the ΔP by the number of 10-inch equivalents.

Wound Cartridge Elements

All-purpose elements have high dirt-holding capacity

Rosedale continuous-wound cartridge elements come in a wide range of materials, lengths, and micron retention ratings. A highly innovative single-core design is used, eliminating the "joints" common in other manufacturers' elements at 10" intervals. Materials of these elements include cotton, nylon, glass, and polypropylene. Their lengths range form 9-3/4 inches to 40 inches, fitting most cartridge housings in the field. Micron retention ratings are from 200 down to 0.5 microns. These elements offer true depth filtration, higher efficiency, lower pressure drop, and greater solids holding capacity than standard elements and competitive prices.

A full range of center core materials are offered to meet specific filtration requirements. Extended core materials are also available upon request.

The center core covering, for reducing fiber migration, is compatible with and equivalent in ratings to the micron rating of the filter element. The inside diameter of all cartridges is 1 inch and the outside diameter is 2-1/2 inches.

Rosedale Water Service Membrane Cartridges

Cost effective units for DI Water applications

WS Series Membrane Cartridges are designed to meet the special needs of the electronics and high purity chemical industries. These cartridges are resistant to most acids and bases and capable of handling strong sanitization agents. The high flow rates achieved by our cartridges make them an ideal source for central DI water systems. They also handle elevated process temperatures in compatible fluids.

Flow Rate

The following table represents typical water flow at one psid (69 mbar) across a single 10 inch cartridge element. The test fluid is water at ambient temperature. Extrapolation for housings with multiple elements or higher pressure drops is acceptable. However, as flow increases, the pressure drop attributed to the housing itself will become evident.

Rosedale Pharmaceutical Service Membrane Cartridges

Cost effective units for Pharmaceutical Industry applications

PS Series Membrane Cartridges are designed to be used as sterilizing grade cartridges for the pharmaceutical industry. The PS Series Membrane is optimized for retention, so additional layers are not necessary. Ideal for use in Sterile Fill applications and SVPs and bio products. Polyethersulfone is particularly suited for filtration of products whose constituents, such as preservatives, can adsorb to the media. Also works well with valuable protein solutions such as vaccines and other biological substances.

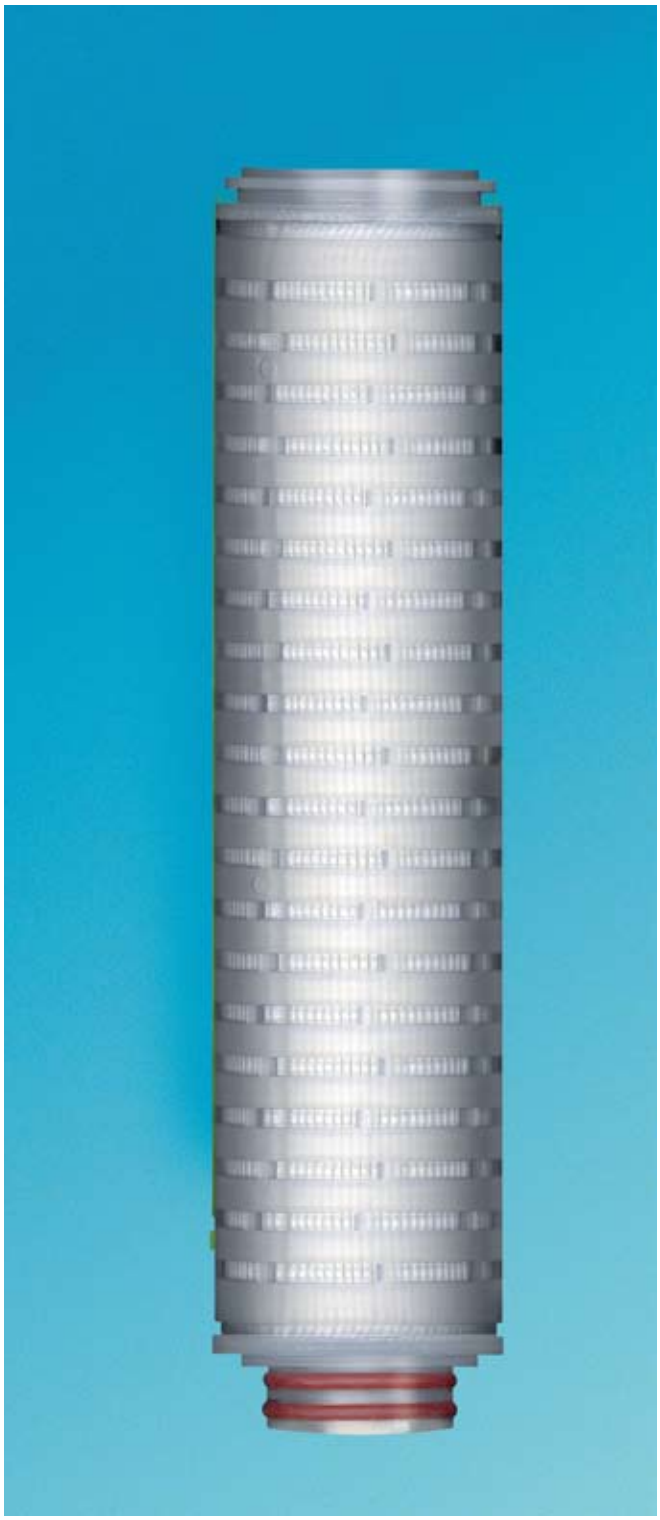
Rosedale General Service Membrane Filter Cartridges

Cost effective units for industrial applications

GS Series Membrane Cartridges are designed for general industrial service where the need for cost effective filtration is a must. These cartridges utilize a pleated membrane design, incorporating the maximum amount of media that can be used in a cartridge. These units, manufactured for general industrial use, are manufactured to the same high standards as our special application cartridges. Pore sizes start at 0.03 µm with a polyethersulfone membrane.



Flow Rate

The following table represents typical water flow at one psid (69 mbar) across a single 10 inch cartridge element. The test fluid is water at ambient temperature. Extrapolation for housings with multiple elements or higher pressure drops is acceptable. However, as flow increases, the pressure drop attributed to the housing itself will become evident.

GS Series Flow Rate

Rosedale Electronics Service Membrane Cartridges

Cost effective units for Electronics Industry applications

ES Series Membrane Cartridges are designed to meet the special needs of the electronics and high purity chemical industries. The high flow rates achieved by our cartridges make them an ideal source for central DI water systems. They also handle elevated process temperatures in compatible fluids.

Flow Rate

The following table represents typical water flow at one psid (69 mbar) across a single 10 inch cartridge element. The test fluid is water at ambient temperature. Extrapolation for housings with multiple elements or higher pressure drops is acceptable. However, as flow increases, the pressure drop attributed to the housing itself will become evident.

Introduction

In many applications, baskets are a good alternative to replace filter bags or other media. Basket design varies greatly depending on the application.

Media Characteristics

This information is intended to be used as a general guideline. Since some characteristics are very similar from one media to the next, you should choose the media whose advantages best fit your particular filtration requirements. Consult Rosedale for assistance in selecting the proper media for your application.

Wedge Wire (WW) or slotted, is the most durable of all backwashable media. They are strictly limited to .001" slot or 25 micron as the lowest retention rating. Wedge wire is particularly suited for critical low maintenance applications. As a result of their construction, they are used in many instances where manual cleaning is necessary but might damage other types of media.

MICRON RATING	OPENING (INCH)	% OF OPEN AREA
25	.001	2.1
50	.002	4.2
75	.003	6.1
150	.006	11.5
250	.010	18.0
350	.014	23.0

Poroplate® filter media is made from layers of stainless steel wire cloth diffusion-bonded together to form a rigid porous metal laminate structure. Poroplate filter media is corrosion resistant, cleanable, and can withstand high temperature applications up to 800°F. Micron ratings from 2 to 150 are available.

MICRON RATING	NOMINAL RATING	ABSOLUTE RATING
10	2µ	10µ
25	10µ	20µ
50	20µ	40µ
75	40µ	70µ
100	100µ	100µ
150	150µ	150µ

Rosedale Cleanable Baskets

Replaces bag filters with multiple layers of stainless steel wire-woven cloth, diffusion bonded together for increased strength, corrosion resistance, and long life.

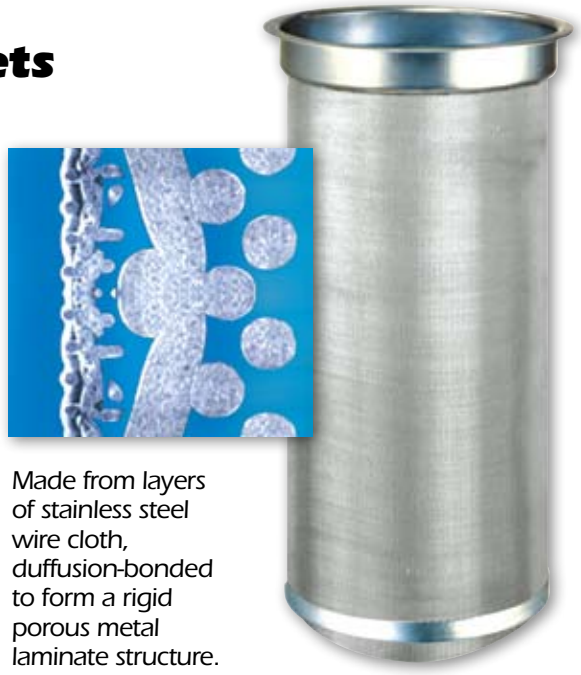
One piece construction for ease in handling, no need for a perforated basket for support, no need for a bag for filtration, basket becomes the filter media.

Sized to replace #1 or #2 bag filters and perforated strainer baskets.

FEATURES

- All 316 stainless steel construction
- 6 micron ratings
- 10-150 micron absolute
- TIG welded construction for long life
- Easily cleaned
- Additional end ring configurations to fit other liquid bag housings
- Custom applications available

See next page for How to Order.



Made from layers of stainless steel wire cloth, duffusion-bonded to form a rigid porous metal laminate structure.

Cone Baskets

Cone baskets are valuable when a large filtering area is needed in a small space. They are available as a basket within a basket, or a bag within a basket.

Cone baskets are widely used for filtration of solid particles in pharmaceutical, chemical, and food industries.

Please contact Rosedale for ordering information.

How To Order

Rosedale Replacement Baskets

Rosedale manufactures replacement bag filter baskets and basket strainers for a wide range of filter housings made by:

American Felt & Filter
Cuno
Commercial Filters
Eaton
Filter Specialists (FSI)
Filtration Systems
GAF
Ronningen-Petter
Strainrite
Oakland
Plenty

We offer replacements for all current models, and any that have been discontinued by the original manufacturer.

These replacement baskets are made to specifications that equal, or exceed the original manufacturers specifications.

Basket Construction

STAINLESS STEEL: Standard material is 304 stainless steel. 316 stainless steel is available as an option.

Basket Media Selection

PERFORATED STRAINER AND BAG FILTER BASKETS: For cleanable basket strainers, choose from the following perforation diameters: 1/4, 3/16, 9/64, or 1/16 inch. For filter bag baskets: standard 9/64-inch diameter perforations with 51 percent open area are supplied.

Perforated

With wire mesh lining

PERFORATED WITH WIRE MESH LINING STRAINER AND FILTER BAG BASKETS: Stainless steel wire is used in mesh sizes 30, 60,100,150, or 200. When used as a bag filter basket, the following advantages are realized:

- Fiber migration is minimized.
- In the unlikely event of bag rupture, the wire mesh contains the contaminant.
- Bag material cannot become "lodged" in the perforations due to extreme pressure differential.
- Flow characteristics are enhanced when using monofilament bags.

Model CF
Replaces Commercial Filter baskets SB11, SB12

Model CU
Replaces Cuno baskets 7PC1, 7PC2

Model RP
Replaces Ronnigen-Petter baskets 224, 324, 424, 152

Model AFF/GAF
Replaces American Felt & Filter/ GAF baskets 112, 122, AMS R, AMC R, NCX, RBX 1L, RBX 2L

How To Order

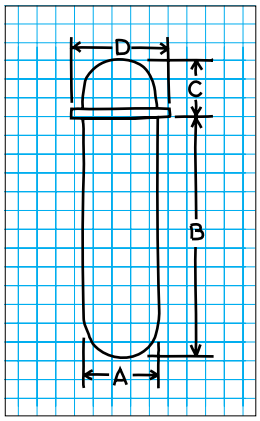
304 stainless steel construction	= **S**
All 316 stainless steel construction	= **S316**

*Additional options available. Consult factory.

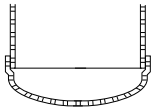
Rosedale can manufacture any basket to your specifications.

Send us a drawing, or just a simple sketch as shown, and we'll submit a quote for your review.

A = Basket diameter
B = Basket height
C = Bail height
D = Outside diameter of rim



Basket Designs



Standard filter bag baskets have rounded perforated bottoms.

Mesh lined bag baskets have round solid bottoms.

Strainer baskets have flat non-perforated bottoms.

Model STR
Replaces Strainrite baskets UF1-90, UF1-180

Model FF
Replaces Filtration Systems baskets 112, 122

Model FSR

Model FS

Model FSR or FS
Replaces all Filter Specialists baskets

Turn Bag Housings Into Cartridge Filters!

Basket holds cartridges inside a bag housing!

Rosedale's bag filter converter can be quickly converted to a cartridge filter. Simply put, there are applications that call for a bag filter and others that call for a cartridge filter. Until now, it wasn't very easy to change between the two.

If it becomes necessary to change from bags to cartridges – install the Rosedale Converter Basket.

- Remove the original basket
- Install the new converter basket
- Load the cartridges
- Unique design prevents clean side contamination by removing basket from housing before removing cartridges from converter

You now have a cartridge filter able to utilize any standard cartridge.

Baskets fit standard models 4-12, 8-15, and 8-30 housings. Construction materials are either 304 stainless or 316 stainless steel.

Flow is introduced from above and circulates around cartridges. Fluid flows through cartridge walls, leaving contaminant on media, and "clean" fluid exits through bottom outlet.

How To Order

Build an ordering code as shown in the example below

EXAMPLE: **BC1 - S**

BASKET CONVERTER = BC

BASKET SIZE (IN INCHES, NOMINAL)

OD	Length	
6.5	10	= **1**
6.5	20	= **2**
4	10	= **4**

CONSTRUCTION MATERIALS

304 Stainless Steel = **S**
316 Stainless Steel = **S316**

See pages 190-191 for more information on Wound Cartridges and Stainless Steel filter cartridges.

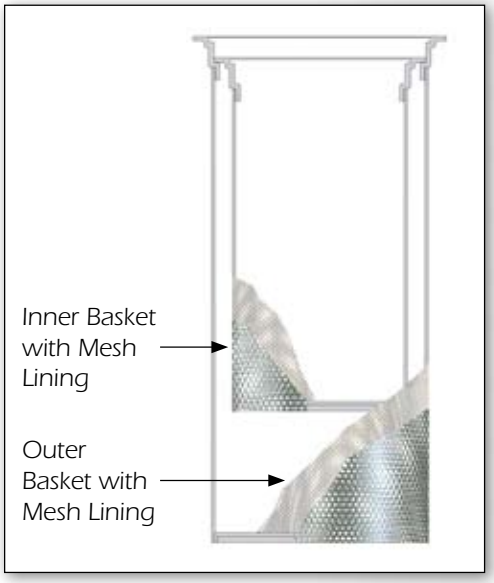
Dimensions

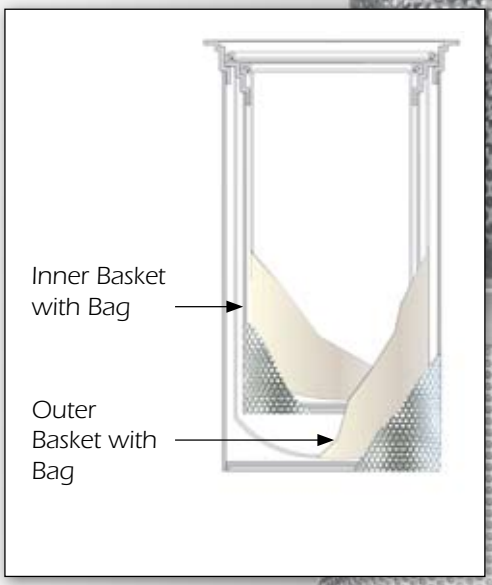
Housing Size & Cartridge Capacity	Model Code	OD*	Length*
Model 4 1 cartridge	BC4	4	10
Model 8 3 cartridges	BC1	6.5	10
	BC2	6.5	20

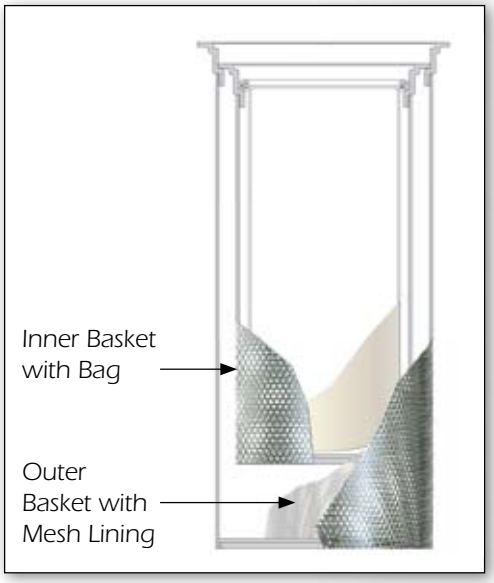
*Nominal in inches

Inner Baskets and Bags

Model 8 and any of the multi-basket or multi-bag units can be fitted with smaller, inner basket strainers or bag filters, through which the in-coming fluid flows first, giving two-stage cleaning action. Inner baskets and bags are offered in the same construction materials and ratings as those of the primary outer elements.



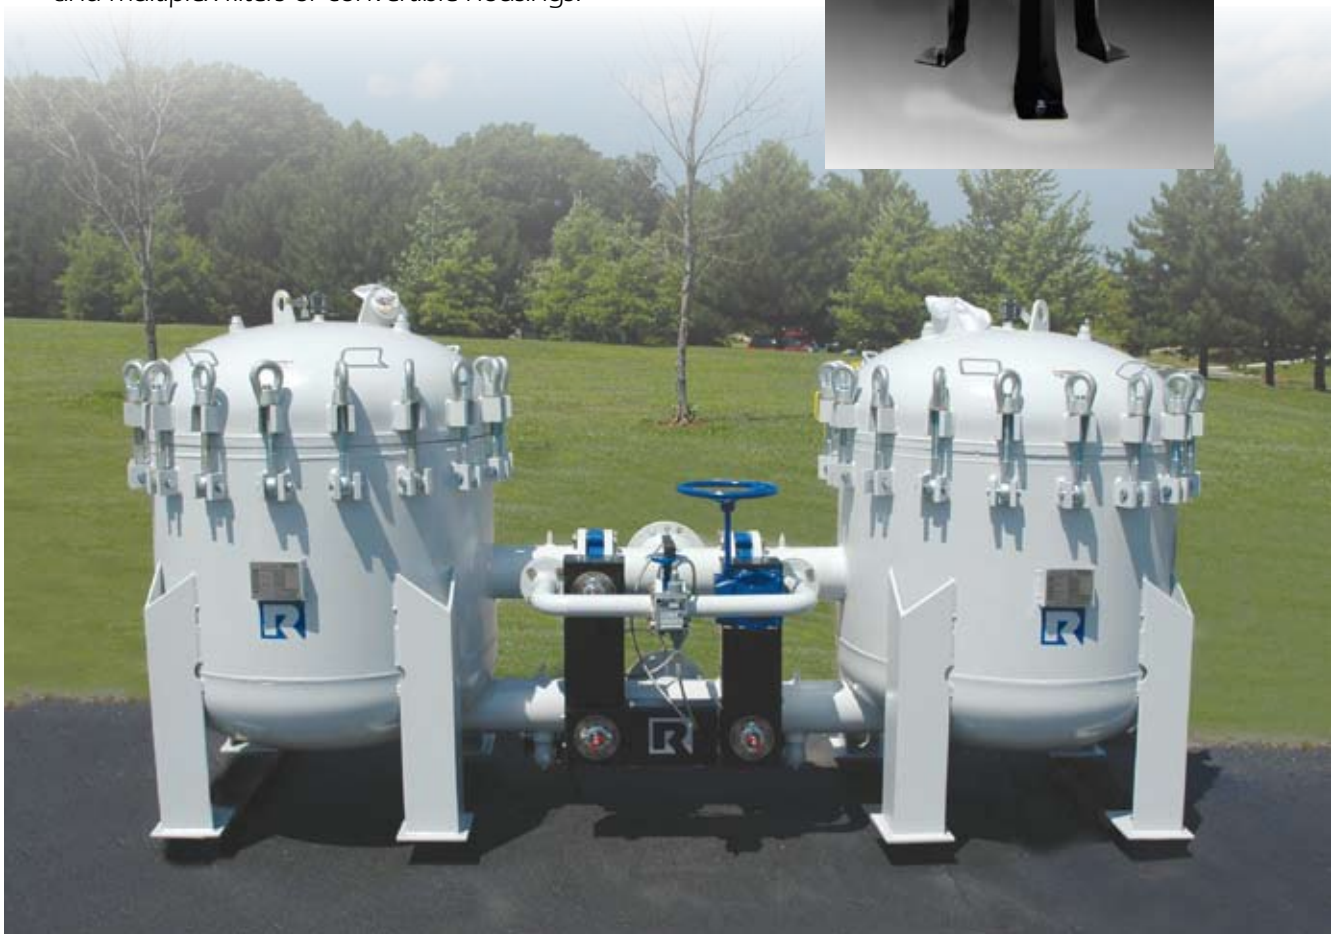


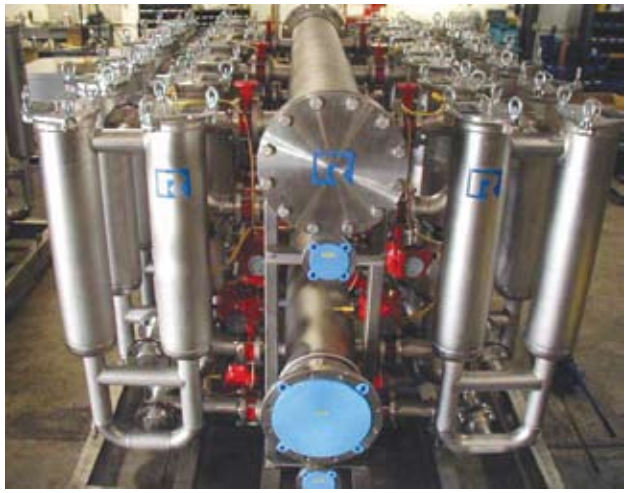


Custom Manufacturing Solutions

We can build anything from simple modifications on standard housings, to customer specified skid-mounted filtration systems. These can incorporate filters, strainers, separators, controllers, sensors, and automated operations.

Rosedale has a long history of innovative filtration designs. They are as simple as our Model 4 Housing or as complex as our multi-station Automatic Backwashing Filtration Systems. Using our expertise, we work with our clients to manufacture systems that meet their needs. Some of our standard models started out as solutions to a client's need, such as the duplex and multiplex filters or convertible housings.





In this section, you'll see several examples of filters and filtration systems that show what we can do for you.

These systems incorporate any number of filtration solutions including:

- Basket strainers
- Bag filters
- Cartridge filters
- Solids/liquids separators
- Single layer bags
- Multilayer bags
- Bag sized cartridges
- Wound cartridges
- Membrane cartridges
- Stainless steel cartridges
- "Smart" controls
- Differential pressure sensors

- Pumps and motors
- Controllers
- Skid or cart mounting
- Pit mounting
- Gangways for access

Application specific components:

- Oxygen concentrators,
- Heated jacketing
- Internal coatings

We also take your specific flow requirements into account, ensuring that the system we design will not restrict your process. For more information, contact Rosedale to get started today.

Special Configuration Skid Packages

Filter For Natural Gas Use

Filter CNG between supply and compressor for improved product quality and longer compressor life. Removes impurities and particulate matter for longer compressor life.

Special Options And Accessories

For improved filtration!

Rosedale offers answers to your specific needs with a wide range of options and accessories. If your specific needs are not represented here, please call us. We will discuss how we can solve your problems.

Rosedale Accessories

Heated Jacketing For Resins, etc.

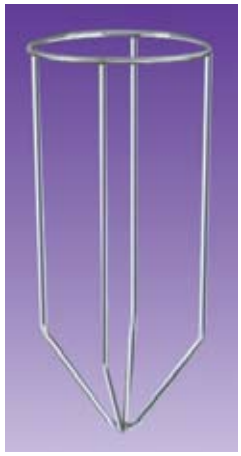
All Rosedale filter housings can be fitted with heated jacketing for improved filtration of resins, adhesive coatings, and viscous materials. The entire vessel can be enclosed by the jacketing, including the inlet and outlet nozzles. The unit is rated to 600°F, requiring metallic seals (included). The housing is electropolished to prevent product buildup, maintaining clean inside walls.

Bag Hold Down Assemblies

Hold down assemblies can be supplied with any Rosedale filter housing.

Internal Coatings

Special coatings can be internally applied to any of Rosedale's housings, meeting your special requirements. These coatings include epoxy, with other coatings available. Call Rosedale for more information or product compatibility.

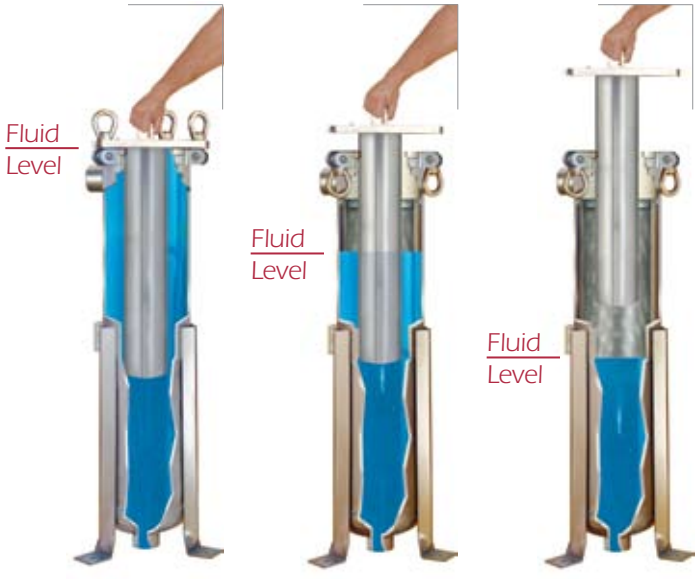


Bag Restrainer

This restrainer expands the bag fully during filtration, insuring that it doesn't fold over on to itself, reducing the amount of material used in filtration. It can also be used in conjunction with the liquid displacer, easing its installation.

Differential Pressure Indicators

All Rosedale filter housings can be fitted with pressure indicators that tell the operator when the element needs servicing. This improves the process quality, reduces system downtime and maximizes efficiency of plant operations. A variety of options are available including standard liquid-filled gauges, differential pressure gauges, differential pressure switches, or a combination switch and gauge. Recommended change-out of most elements is 15 psid.



Liquid Displacers

Rosedale filter housing models 4, 6, and 8, as well as our convertible filter housings, can be supplied with a liquid displacer attached to the cover. When in use, the displacer (a sealed 304 stainless steel cylinder) fits inside the basket strainer or bag filter, displacing liquid that would otherwise fill the inner space. When the cover and attached displacer are removed, the level of the liquid within the basket strainer of bag filter drops resulting in less product loss, and fast easy changes.

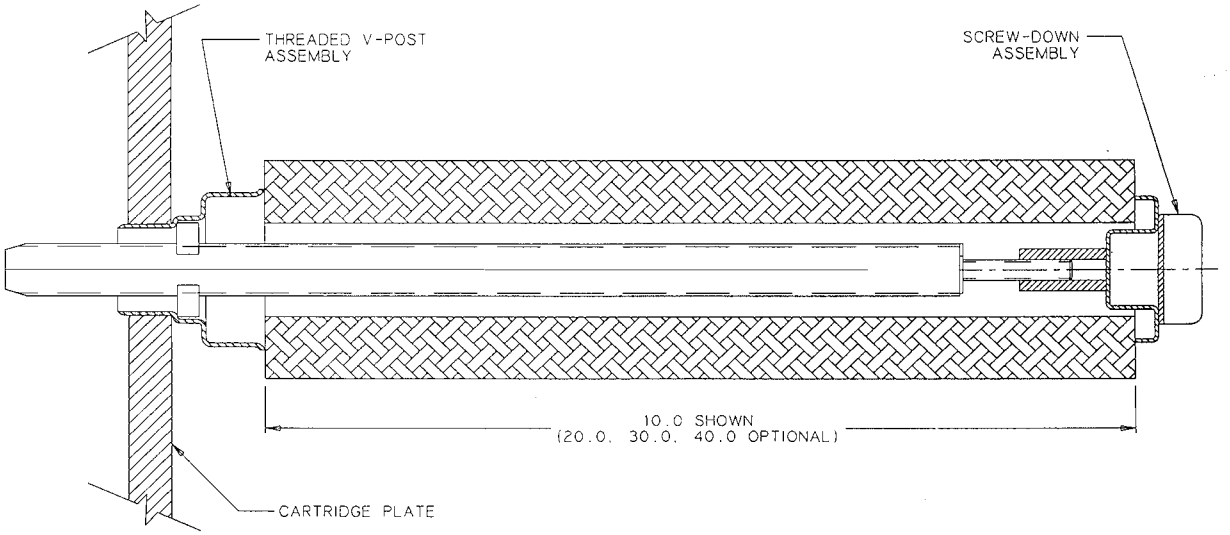
Recommended Maximum ΔP for Standard Rosedale Baskets

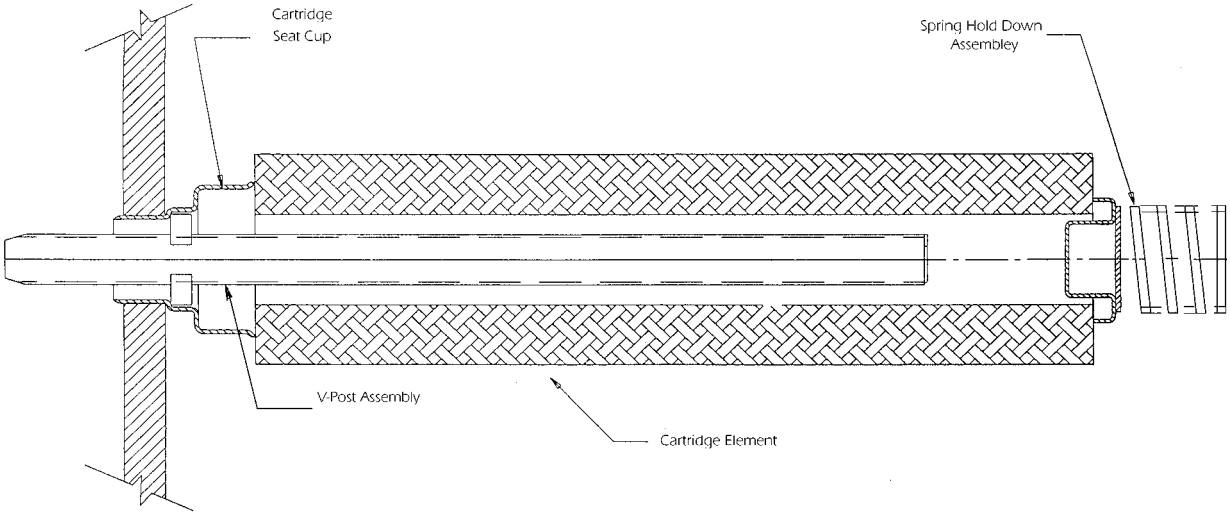
The recommended maximum operating ΔP for standard Rosedale Baskets is 15-20 psid. The baskets should not fail catastrophically until they reach a ΔP of 60-70 psid. We must consider the fact that there is a rapid rise in ΔP once the differential pressure reaches 30 psid. The time required for the ΔP to increase from 30 psid to 60-70 psid is very short (the actual time depends on many factors, dirt load, viscosity, etc.), this is why it is recommended that the filter basket be serviced at a differential of 15-20 psid.

If cyclical loadings or pulses must be considered, a reduction in the recommended maximum ΔP should be taken (reduction dependent on severity of pulse, viscosity, etc.). These pressure spikes will adversely affect the integrity of the filter basket.

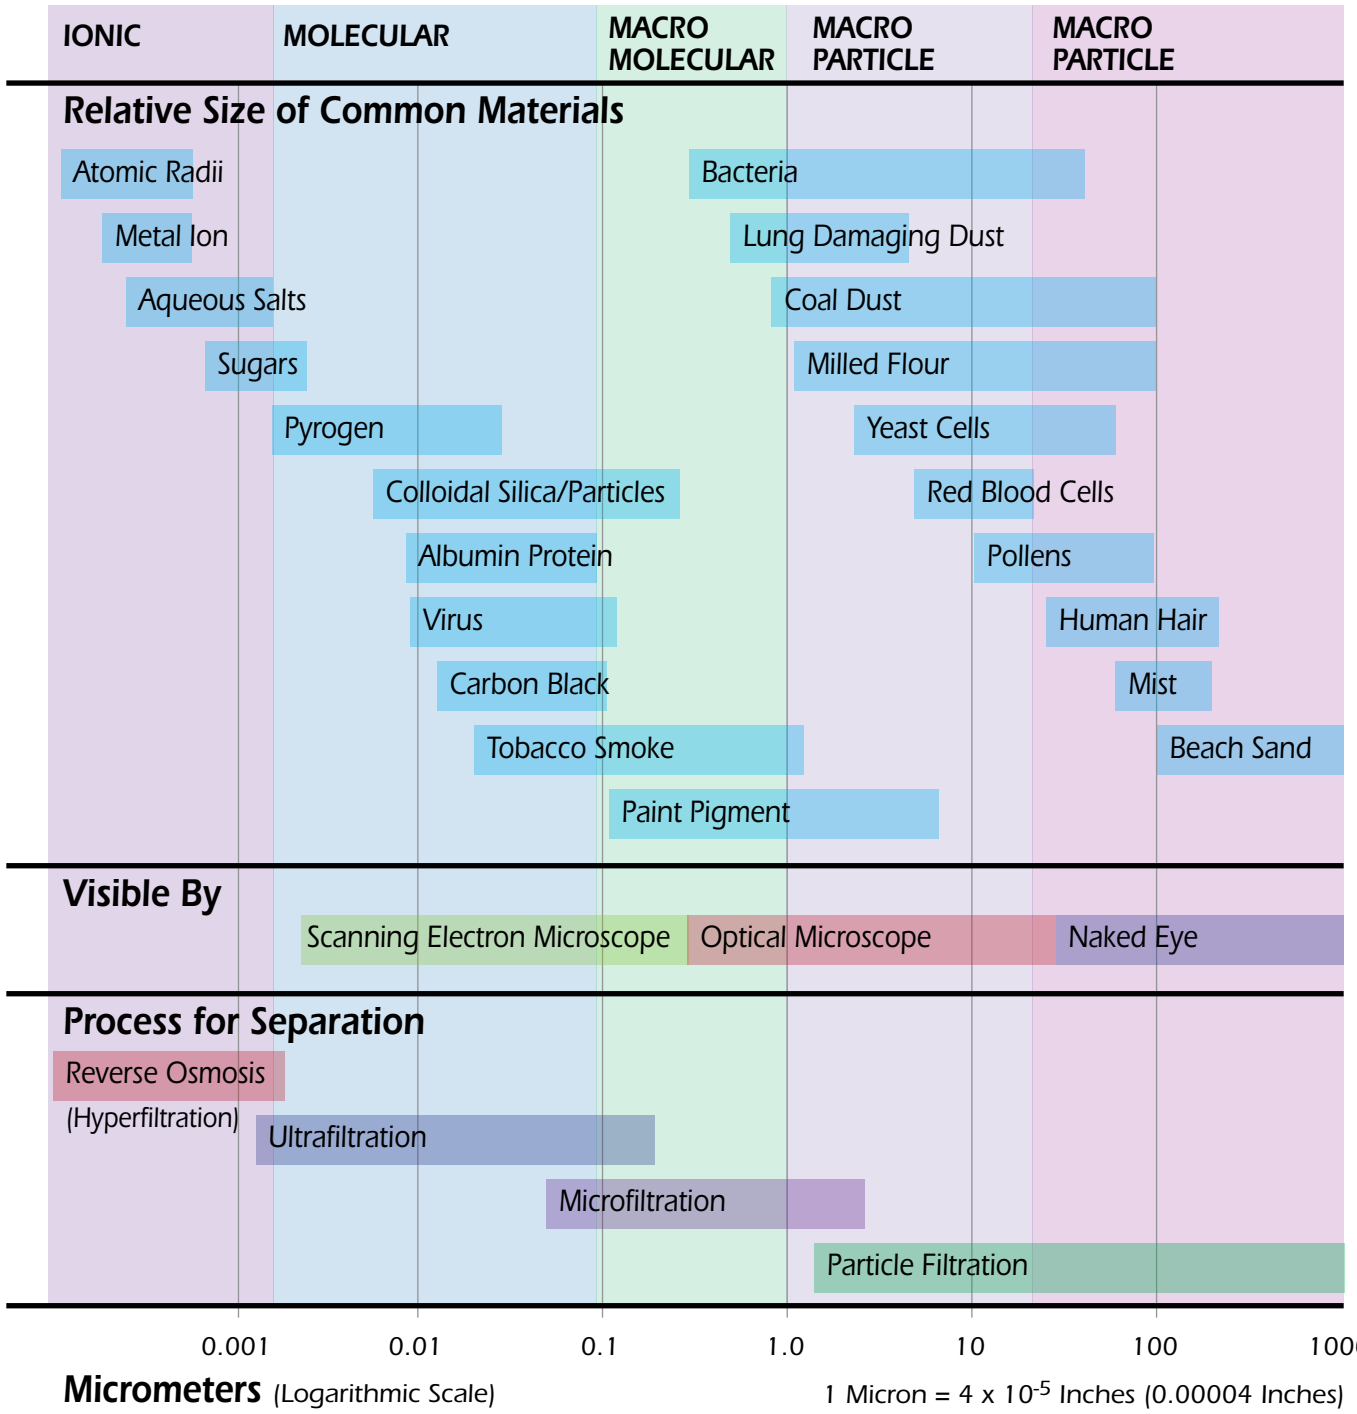
The above information is for filter baskets only. If a filter bag is utilized, it is critical that the ΔP never exceeds 15 psid. A filter bag can not withstand a high differentialpressure.

Rosedale Cartridge Sealing Options For Standard Vessels



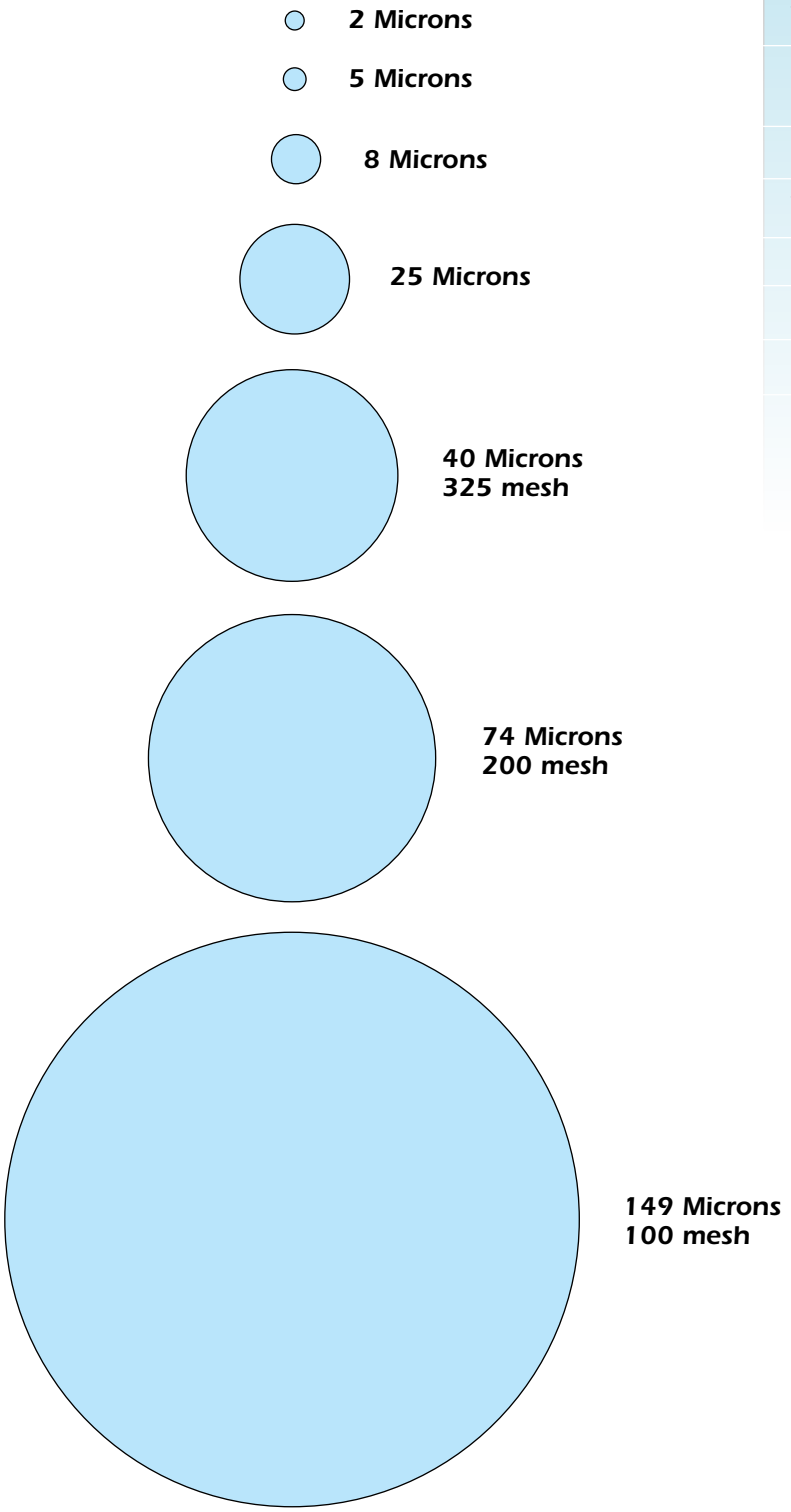


FILTRATION RANGES



Relative Size of Particles

Magnification 500 times

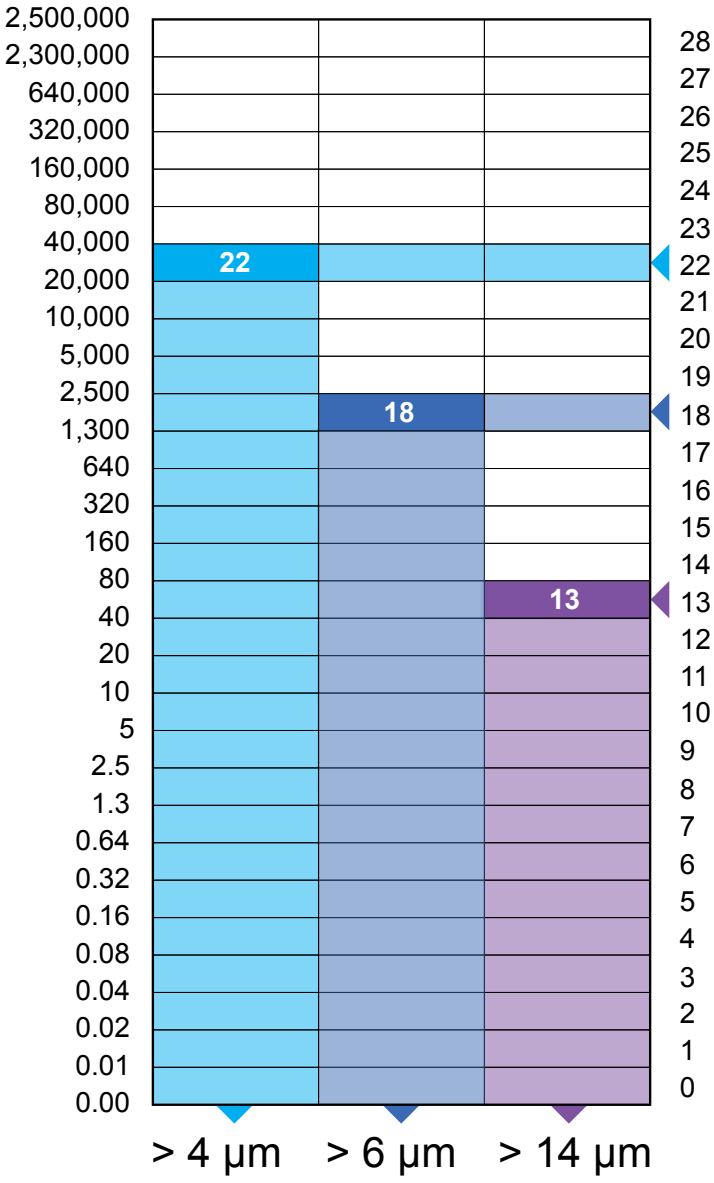


Micron Comparisons

Substance	Microns
Table salt	100
Human hair (average dia.)	50-70
White blood cell	25
Talcum powder	10
Cocoa	8-10
Red blood cell	8
Bacteria (cocci)	2

Note: Lower limit of visibility (naked eye)–40 Microns

ISO 4406 Code



Each number refers to ISO Range Code, which is determined by number of particles for that size (4/6/14) and larger present in 1 ml of fluid.

EXAMPLE:

- Larger Than 4 µm = **22,340**
- Larger Than 6 µm = **1,950**
- Larger Than 14 µm = **43**

ISO Code = **22 / 18 / 13**

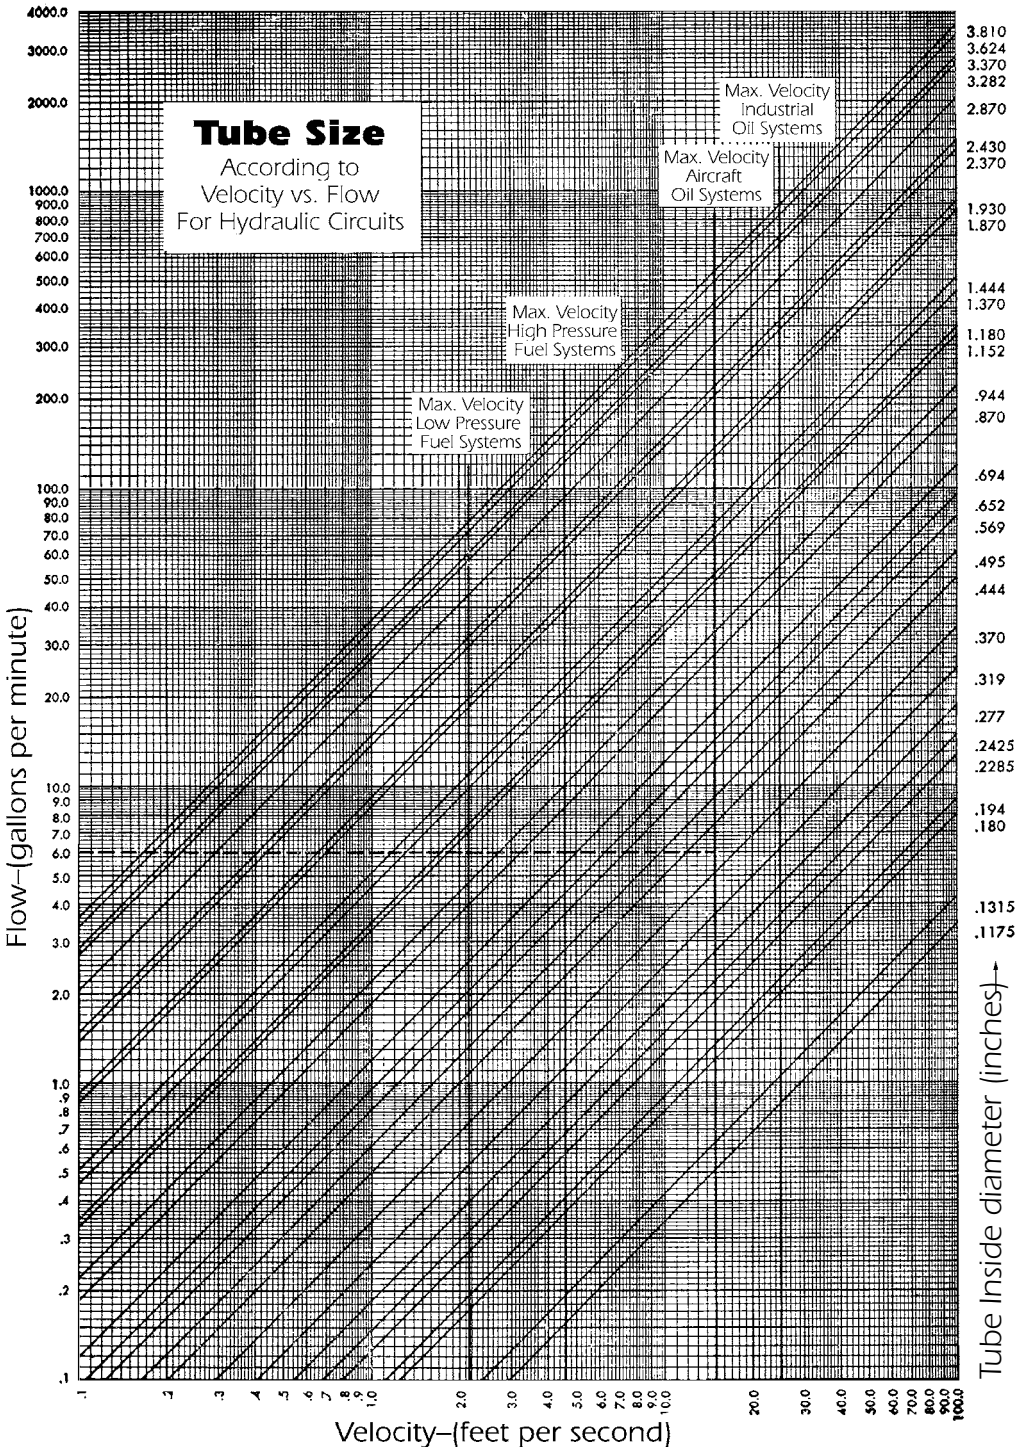
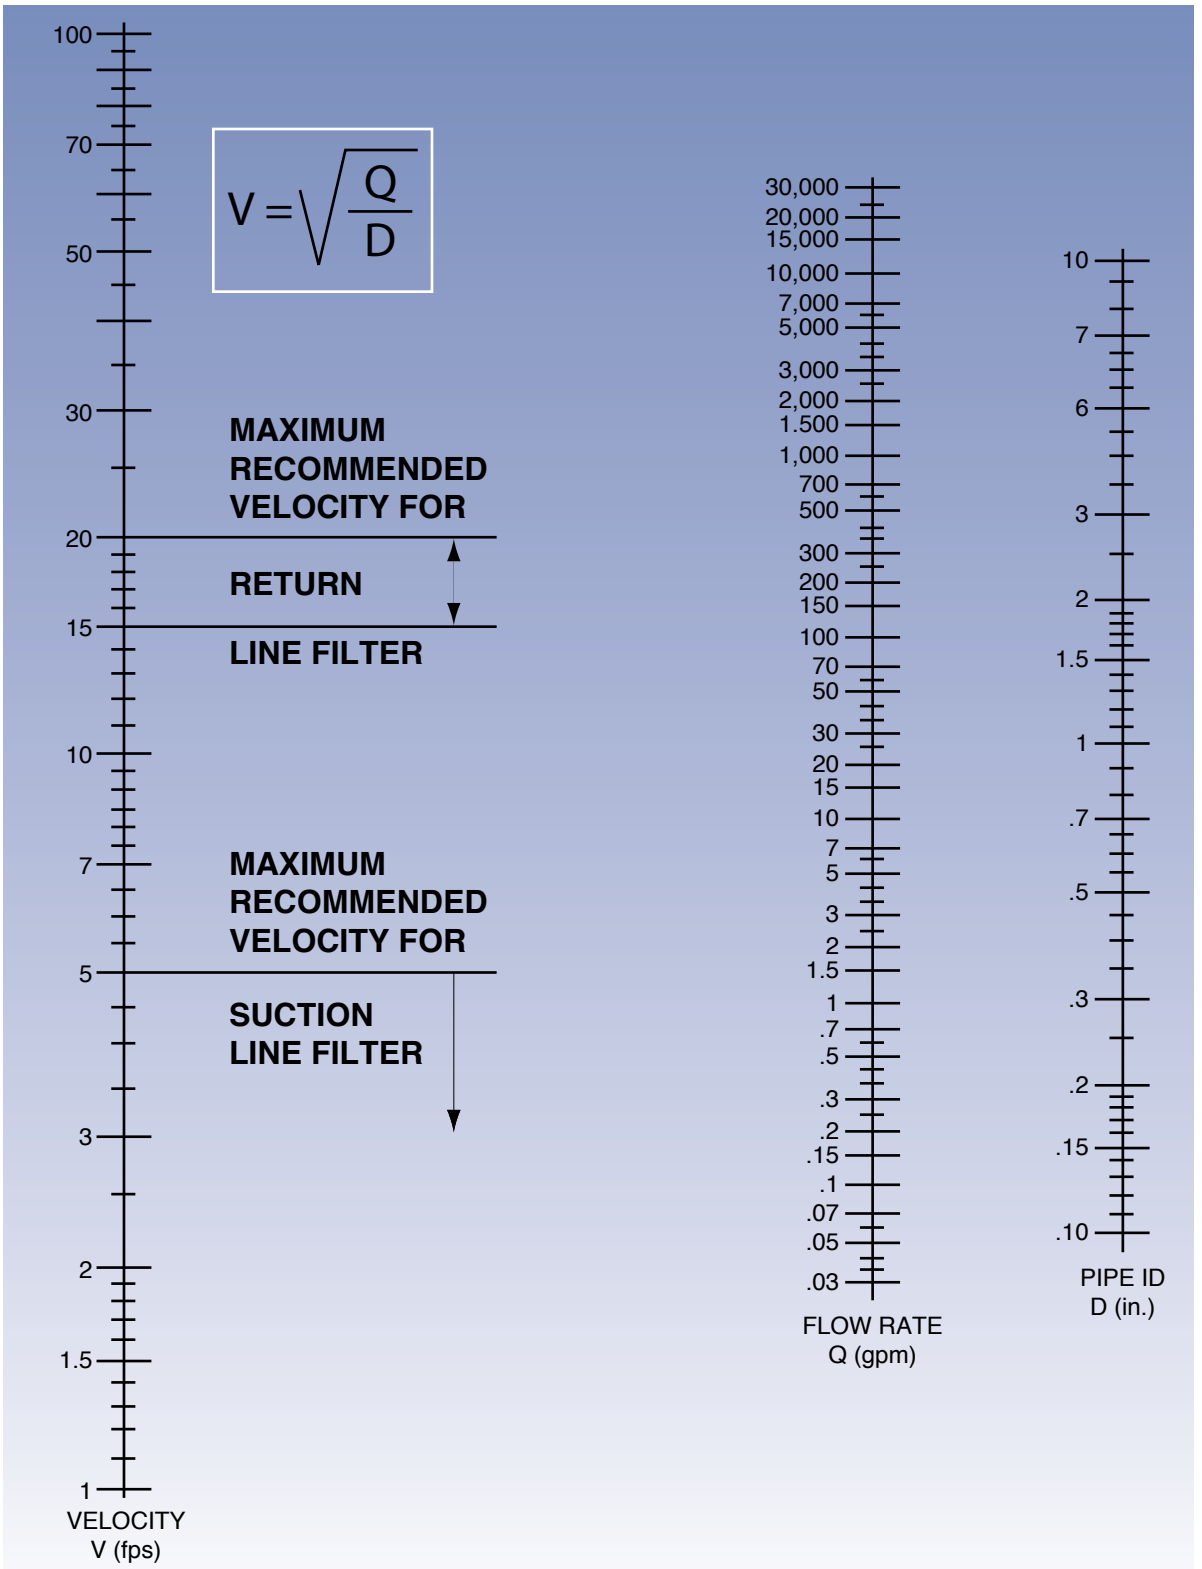
Note: One foot of water at 62° F equals .433 pound pressure per sq. inch. To find the pressure per sq. inch for any feet head not given in the table, multiply the feet head by .433

Velocity vs. Flow Table



Flow Rate in Pipe

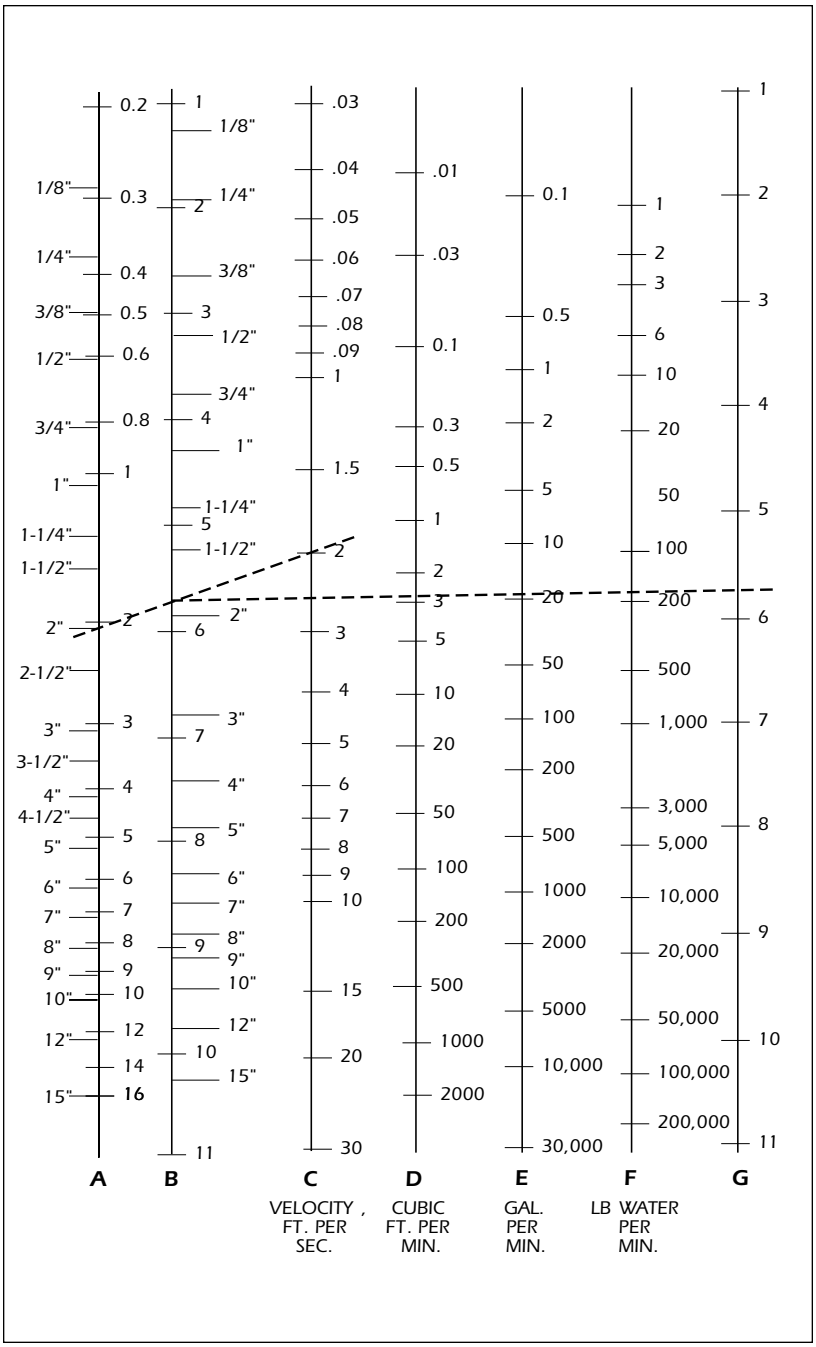


Flow Conversion Chart

This Nomograph/Chart provides flow rate data in cubic feet per minute (column D), gallons per minute (column E). Or pounds of water per minute (column F) for inside pipe diameters from 0.2 to 16 inches for velocities from 0.03 to 30 feet per second (column C). Similarly, velocities may be determined from flow rates.

An example is shown for 2 inch standard pipe (2.07" ID) at 2 feet per second. A line is drawn connecting these two values in columns A and C. At it's intersection with column B a line is drawn horizontally using columns H1 and H2 for guidance. Flow rates are now seen in columns D, E, and F.

A second example uses 4 inch extra heavy pipe at 10 feet per second. A horizontal line is drawn to the left from column B to column A and this intersection is connected to the 10 feet per second location on column C. At the intersection of this slanting line with column B a horizontal line is drawn to show the flow rates resulting.



Converting Air Flow to Liquid Flow Equivalents

You must first establish the gas flow rate in units of standard cubic feet per minute (SCFM). (A "standard cubic foot" of gas is measured at 14.7 psia (pounds per square inch, absolute) at 60^0 F.

$$\textbf{SCFM} = \text{CFM} \times \left(\frac{14.7 + \text{PSIG}}{14.7}\right) \times \left(\frac{530}{460 + \text{F}}\right)$$

SCFM = Gas flow in standard cubic feet per min.
CFM = Actual gas flow in cubic feet per min.
PSIG = Actual gas pressure, pounds per square inch, gauge.
F = Actual gas temperature, F^o.

Next we find the gallons-per-minute equivalent to your particular gas flow, temperature, and pressure:

$$\textbf{GPM} = \frac{\text{SCFM}}{4.1} \times \sqrt{\frac{14.7 + \text{PSIG}}{14.7}} \times \sqrt{\frac{460 + \text{F}}{530}} \times \sqrt{\text{SG}}$$

SG = Specific Gravity of the gas, relative to air. (See chart below.)

GAS	SG	GAS	SG
Air	1.00	Hellum	.14
Ammonia	.59	Nitric Oxide	1.03
Argon	1.38	Nitrogen	.97
Carbon Dioxide	1.52	Nitrous Oxide	.59
Chlorine	2.45	Sulphur Dioxide	2.21

Note: Steam and explosive gases are not recommended.

For Vacuum Applications:

Use the following formula for converting vacuum applications to GPM.

$$\textbf{GPM} = \frac{\text{SCFM}}{4.1} \times \sqrt{\frac{14.7 + \text{PSIG}}{14.7}} \times \sqrt{\frac{460 + \text{F}}{530}} \times \sqrt{\text{SG}}$$

Enclosure Types for Non-Hazardous Locations

Type	NEMA National Electrical Manufacturers Association (Nema Standard 250) and Electrical and Electronic Manufacturers Association of Canada (EEMAC) **NEMA**	Underwriters Laboratories Inc. (UL 50 and UL 508)	Canadian Standards Association (Standard C22.2 No. 94)
1	Enclosures are intended for indoor use primarily to provide a degree of protection against contact with the enclosed equipment or locations where unusual service conditions do not exist.	Indoor use primarily to provide protection against contact with the enclosed equipment and against a limited amount of falling dirt.	General purpose enclosure. Protects against accidental contact with live parts.
2	Enclosures are intended for indoor use primarily to provide a degree of protection against limited amounts of falling water and dirt.	Indoor use to provide a degree of protection against limited amounts of falling water and dirt.	Indoor use to provide a degree of protection against dripping and light splashing of noncorrosive liquids and falling dirt.
3	Enclosures are intended for outdoor use primarily to provide a degree of protection against windblown dust, rain, and sleet; undamaged by the formation of ice on the enclosure.	Outdoor use to provide a degree of protection against windblown dust and windblown rain; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use provides a degree of protection against rain, snow, and windblown dust; undamaged by the external formation of ice on the enclosure.
3R	Enclosures are intended for outdoor use primarily to provide a degree of protection against falling rain and sleet; undamaged by the formation of ice on the enclosure.	Outdoor use to provide a degree of protection against falling rain; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use provides a degree of protection against rain and snow; undamaged by the external formation of ice on the enclosure.
4	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against windblown dust and rain, splashing water, and hose directed water; undamaged by the formation of ice on the enclosure.	Either indoor or outdoor use to provide a degree of protection against falling rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use, provides a degree of protection against rain, snow, wind-blown dust, splashing and hose-directed water; undamaged by the external formation of ice on the enclosure.
4X	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against corrosion, windblown dust and rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure.	Either indoor or outdoor use to provide a degree of protection against falling rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure: resists corrosion.	Indoor or outdoor use provides a degree of protection against rain, snow, wind-blown dust, splashing and hose-directed water; undamaged by the external formation of ice on the enclosure: resist corrosion.
6	Enclosures are intended for use indoors or outdoors where occasional submersion is encountered.	Indoor or outdoor use to provide a degree of protection against entry of water during temporary submersion of a limited depth undamaged by the formation of ice on the enclosure.	Indoor or outdoor use provides a degree of protection against the entry of water during temporary submersion at a limited depth, undamaged by the external formation of ice on the enclosure, resists corrosion.
12	Enclosures are intended for use primarily to provide a degree of protection against dust, falling dirt and dripping noncorrosive liquids.	Indoor use to provide a degree of protection against dust, dirt, flying fibers, dripping water and external condensation of noncorrosive liquids.	Indoor use a degree of protection against circulating dust, lint, fibers and flyings. dripping and light splashing of noncorrosive liquids, not provided with knockouts.
13	Enclosures are intended for indoor use primarily to provide a degree of protection against dust, spraying of water, oil and noncorrosive coolant.	Indoor use to provide a degree of protection against lint, dust seepage, external condensation and spraying of water, oil and noncorrosive liquids.	Indoor use provides a degree of protection against circulation dust, lint, fibers and flyings, seepage and spraying of noncorrosive liquids, including oils and coolants.

Temperature Data

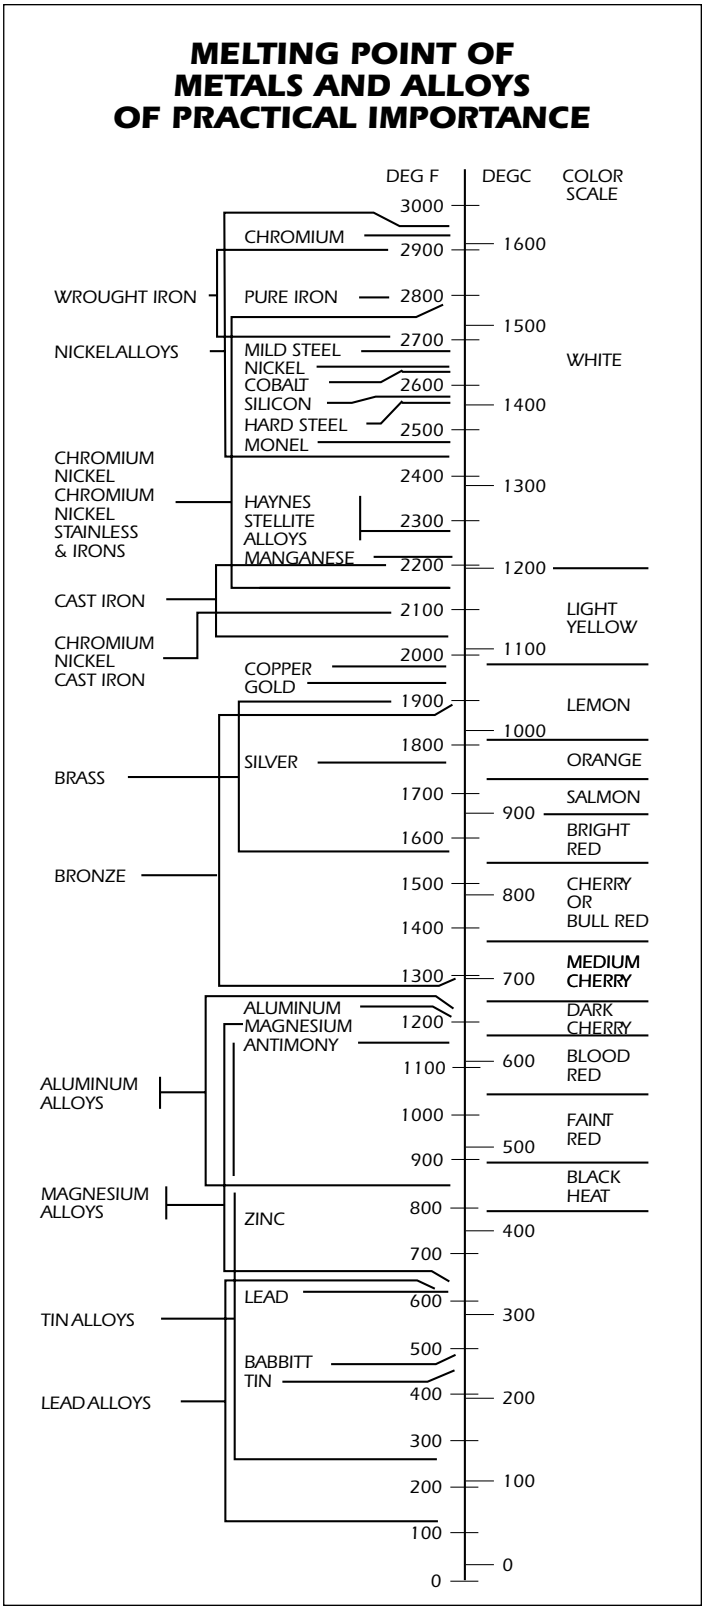
The accompanying chart not only lists the melting points of various alloys and metals but also serves as a convenient means for conversion between Centigrade and Fahrenheit temperature scales. In addition, on the far right of the scale are shown the color designations that are commonly used in judging the temperatures of hot metal by color.

Melting Points

This chart should prove useful to all welding operators for it contains basic information on working with metals at elevated temperatures. Reference to the chart, for instance, shows why aluminum and aluminum alloys, because of their low melting points, give little or no indication by change in color when they approach welding heat. On the other hand, the high melting point of wrought iron explains why considerably more heat is required to weld this metal than is required for cast iron, for instance.

Temperature Color Scale

Another use for the chart is in estimating the temperature by color. For instance, instructions may require that the part be preheated to 1,100 deg. F. before welding. If you are without a thermocouple or other means for accurately measuring high temperatures, reference to the chart shows the part, at 1,100 deg. F. would have a blood-red color. With a little experience, you can estimate this fairly closely by eye. In this connection, it should be mentioned that the color scale is for observations made in a fairly dark place and without



welding goggles. As the light increases, the color groups on the scale will apply to higher temperatures.

Conversion Data

Finally, the chart is a ready means for converting Fahrenheit to Centigrade, and vice versa. Suppose you are familiar with the Fahrenheit scale, yet instructions call for the quenching of a welded part from 900 deg. C. Reference to the chart shows this to be approximately 1,650 deg. F.

(Stuff You Probably Know)

1. PASCAL'S LAW: Pressure exerted on a confined fluid is transmitted undiminished in all directions and acts with equal force on all equal areas and at right angles to them.

2. Hydraulics is a means of power transmission.

3. Work is force acting through a distance.
   WORK = FORCE X DISTANCE.
   Example: Work (in. lbs.) = Force (lbs.) x Distance (in.)

4. Power is the rate of doing work.

$$\text{Power} = \frac{\text{Work}}{\text{Time}} = \frac{\text{Force} \times \text{Distance}}{\text{Time}}$$

5. The force (pounds) exerted by a piston can be determined by multiplying the piston area (square inches) by the pressure applied. (PSI)

$$\text{Force} = \text{Pressure} \times \text{Area}$$

(To find the area, square the diameter and multiply by .7854) $A = D^2 \times .7854$ or

$$\text{Area} = \text{Diameter}^2 \times .7854$$

6. To determine the volume (cubic inches) required to move a piston a given distance, multiply the piston cross sectional area (sq. Inches) by the stroke required (inches).

$$\text{Volume} = \text{Area} \times L$$

7. Hydraulic oil serves as a lubricant and is practically non-compressible. It will compress approximately .4 of 1% at 1000 PSI and 1.1% at 3000PSI. at 120°F.

8. The weight of hydraulic oil may vary with a change in viscosity, however, 55 to 58 lbs. per cubic foot covers the viscosity range from 150 SSU to 900 SSU at 100°F.

9. Pressure at the bottom of a one foot column of oil will be approximately 0.4 PSI. To find the approximate pressure in psi at the bottom of any column of oil, multiply the height in feet by 0.4.

10. Atmospheric pressure equals 14.7 PSIA at sea level. ΔP means pressure difference.

11. Gage readings do not include atmospheric pressure unless marked PSIA.

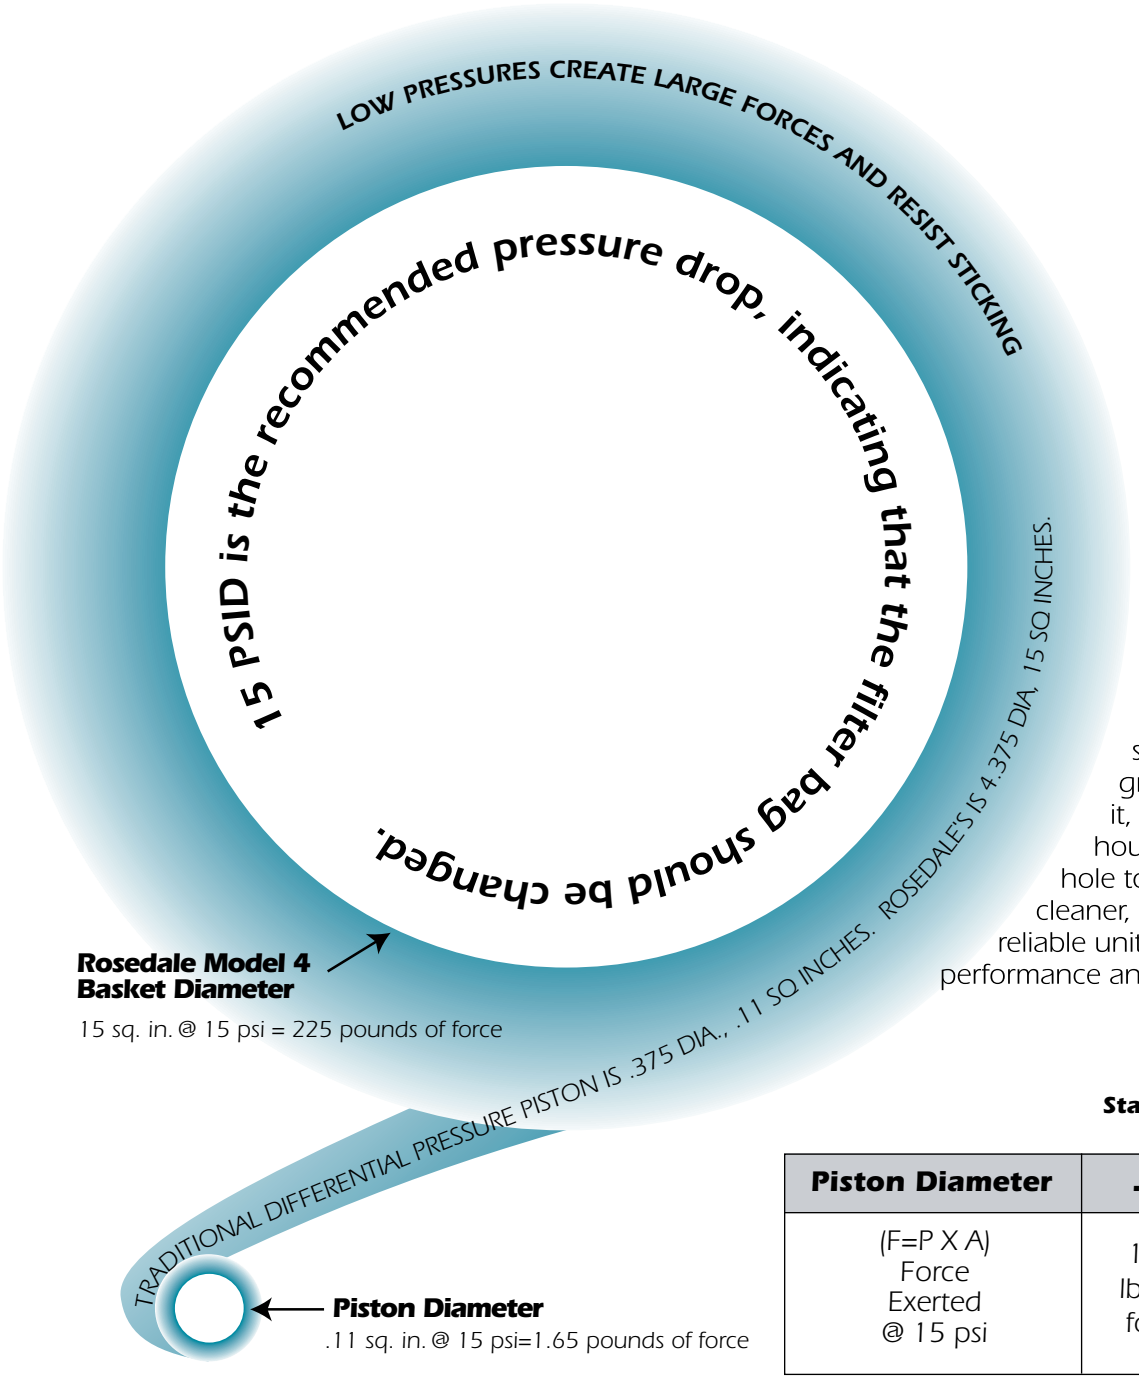
12. There must be a pressure drop (pressure difference) across an orifice or restriction to cause flow through it. Conversely, if there is no flow there will be no pressure drop.
   $F = P \times A$

13. A fluid is pushed, not drawn, into a pump. If pumping from an open reservoir, atmospheric pressure pushes the fluid into the pump. Some pumps are used specifically to create pressure, any resulting flow is incidental.

14. A pump does not pump pressure; its purpose is to create flow. Pumps used to transmit power are usually positive displacement type.

15. Pressure is caused by resistance to flow. A pressure gage indicates the pressure in some unit as psi.

Force Equals Pressure Times Area



Most differential pressure indicators use a piston connected through a small hole in the side of the filter. This hole could clog, or the piston could easily be blocked or restricted. Rosedale's piston is much larger in diameter and surface area, requiring a greater blockage to restrict it, and since it is inside the housing, there is no outside hole to clog. It produces a cleaner, more accurate and reliable unit, providing excellent performance and value.

	Standard	Rosedale Model 4
Piston Diameter	**.38**	**4.38**
(F=P X A) Force Exerted @ 15 psi	1.65 lbs. of force	225.00 lbs. of force

a. Diamond pyramid indenter; 5-120 kg load. b. 10mm diameter ball, hardened steel or tungsten carbide; 3,000 kg load. c. Brale (diamond cone) indenter; 60 kg load. d. 1/16-inch diameter steel ball; 100 kg load. e. Brale (diamond cone) indenter; 150 kg load. f. Brale (diamond cone) indenter; 100 kg load. g. Sclerosope; Diamond-tipped hammer.

Note: Vickers, Brinell, and Rockwell tests indicate hardness by indentation measurements; Shore test indicates hardness by height of rebond. Values in parentheses are approximate. Reference: ASM Metals Handbook, 8th Edition, Vol 11, Nondestructive Inspection and Quality Control.

ASME Coded Vessels and Radiography

1. Full Vacuum: All filter vessels are designed with Full Vacuum as a design condition. If the customer requires this, it can be documented. It is typically not stated on the ASME nameplate that the vessel is designed for Full Vacuum.

2. Jacketed housings: All standard filter vessels are designed with consideration of a jacket rated at 1/2 vessel pressure (ex. 150 psi vessel, 75 psi jacket) without modifying the body shell. This condition is valid for a body shell jacket only; any other type of jacket or pressure ratings may not meet the code requirements (ex. full jacket, head & body), please consult Engineering.

3. Canadian Registry: We hold several "CRN" (Canadian Registration Number) registration numbers for our vessels in Ontario and British Columbia. Please consult Engineering for this list. To obtain a "CRN", each province has its own requirements and timetable, consult Engineering.

4. Closure Assemblies: Our standard closure assembly for all of our products conform to ASME specification (rod end and clevis pins meet SA-193-B7, eyenuts meet SA-194-2H). Some of our customers request different materials. The only other available material is a 304 stainless steel closure, which is available in all sizes.

5. Welded Attachments: Welded attachments to 316 S.S. vessels (legs, lugs, davit arm bracket, lifting rod, nameplate bracket, etc.) are typically 304 series stainless steel unless specified by customer.

Radiography

Radiography is one of the methods of NDE (Non Destructive Examination) tools utilized in the fabrication of pressure vessels (i.e., Rosedale Filter Vessels). Radiography is a tool used to verify that the welds of the pressure vessel are within allowable quality limits.

The "ASME Code Section VIII, Division 1 Pressure Vessels" gives guidelines for the use of radiography. Radiography is required in Code fabrication for vessels used to contain lethal substances (Lethal Service), when weld joints exceed thickness limits and in unfired steam boilers. For all of Rosedale's standard filter vessels, radiography is not a Code requirement.

When designing a pressure vessel, joint efficiencies are established based on the degree of radiographic examination (Full, Spot or None). Higher joint efficiencies are assigned to higher degrees of examination. Determining the joint efficiency is one design parameter that is critical to optimizing the design of a pressure vessel. This optimization allows for the most economical and efficient usage of components to fabricate the pressure vessel. Therefore, Rosedale can provide a competitively priced filter vessel based on your requirements.

The ASME Code defines several levels of examination. These defined below:

RT-1 Full Radiography

When the complete vessel satisfies the full radiography requirements of UW-11(a) and when the spot radiography provisions of UW-11(a)(5) have not been applied.

RT-2 Full Radiography

When the complete vessel satisfies the full radiography requirements of UW-11(a)(5) and when the spot radiography provisions of UW-11(a)(5)(b) have been applied.

RT-3 Spot Radiography

When the complete vessel satisfies the spot radiography requirements of UW-11(b).

RT-4 Radiography by Designer

When only part of the vessel has satisfied the radiographic requirements of UW-11(a) or when none of the markings RT-1, RT-2, or RT-3 are applicable.

The implications of each of the above levels of radiography can vary depending on the design of your filter vessel. The interpretation of what is required should be determined by Rosedale's engineering staff.

These definitions can also be misleading because of changes in definitions over the years by ASME, misinterpretation of "Full" vs. "Spot" radiography requirements, and customer defined radiography requirements.

Often customers, engineering firms, or end users will specify radiography or other NDE requirements beyond what is specified by the ASME Code. Rosedale can ensure compliance with the requirements of the ASME Code or customers specifications.

Glossary

A

ABRASION: Migration of foreign material which enters the fluid stream from system components that wear from close tolerances, vibration, or shock.

ABRASIVE: Any solid material, such as grit, with erosive properties.

ABRASIVES: Hard structurally strong solid.

ABSOLUTE: An arbitrary term used to describe or define a degree of filtration. The filtration industry uses various methods of determining absolute ratings which are not necessarily interchangeable. Generally absolute references 100% removal of solids (glass beads) above a specified micron rating on a single pass basis. See nominal.

ABSOLUTE: The sum of gage pressure and atmospheric pressure.

ABSORB: To take up by cohesive, chemical or molecular action.

ABSORBENT: A filter medium that holds contaminants by mechanical means. When one substance soaks completely through another, sometimes undergoing a chemical change.

ACIDITY: The quality, state, or degree of being acid. In lubricating oils, acidity denotes the presence of acid-type constituents whose concentration is usually defined in terms of a neutralization number. The constituents vary in nature and may or may not markedly influence the behavior of the fluid.

ADDITIVE: A material, usually chemical, added to a product to impart new or unusual characteristics or to improve existing characteristics.

ADSORB: To take up by adhesion of molecules of gases or dissolved substances to the surface of solid bodies, resulting in high concentration of the gas or solution at place of contact. Gas or solution is condensed on the surface of the adsorbent, while in adsorption, the material absorbed penetrates throughout the mass of absorbent.

ADSORBATE: The material which is adsorbed; i.e., the gas, vapor, or liquid which adheres or is chemically attracted to the surface of the solid.

ADSORBENT: A material which adsorbs; i.e., the solid which attracts and holds on its surface the gas, vapor, or liquid. Also materials added to liquors to decolorize or purify by adsorbing the color or impurity. Fuller's earth, activated carbon, activate alumina, etc. are all adsorbents.

ADSORBENT: A filter medium primarily intended to hold soluble and insoluble contaminants on its surface by molecular adhesion - no chemical change.

ADSORPTION: The natural phenomenon of a gas, vapor, or liquid being attracted to and held on the surface of a solid. To some extent adsorption takes place on any solid surface, but certain materials have sufficient adsorbent capacity because of the finely divided material to make them useful in such industrial applications as the purification and separation of gases and liquids.

AGGLOMERATE: A group of two or more particles combined, joined, or clustered, by any means.

AGGREGATE: A relatively stable assembly of dry particles formed under the influence of physical forces.

AMBIENT: Surrounding. For example, ambient operating temperatures of a vessel is temperature essentially the same as that surrounding the vessel.

ASME: American Society of Mechanical Engineers.

ASPHALTINE: Product of partial oxidation of oil.

ATMOSPHERIC PRESSURE: The force exerted on a unit area by the weight of the atmosphere.

ATOM: Smallest particle of an element which retains properties of the element.
Example: Carbon atom (C).

AUTOCLAVE: Sterilizing apparatus which uses steam at high pressure.

B

BACK PRESSURE: In filter use, resistance offered by filter, usually measured in PSI.

BACKWASH: To clean a filter element by reversing the direction of flow through it.

BASKET STRAINER: Vessel for the removal of coarse bulk solids from liquid, air, or gas; element is a basket covered with a screen of a given mesh.

BED (CAKE): Mass of impurities which form on a filter element.

BLEEDER: A system in which part of
BETA RATIO: An accurate indication of how the filter performs throughout the life of the filter. The Beta Ratio is an average filtration rating.

the fluid from the main flow is diverted.

BLOTTER TEST: A visible means of checking oil clarity; one drop on a blotter will concentrate dirt or foreign matter in the center of the ring.

BLOWBACK: To reverse flow air, steam, or fluid through the media to effect solids removal. Sometimes referred to as backwash.

BRIDGING: A condition of filter element loading in which contaminant spans the space between adjacent sections of a filter element thus blocking a portion of the useful filtration area.

BUNA N: Gasket material. A synthetic rubber frequently used for vessel closures, flanges, and filter elements.

BURST: An outward structural failure of the filter element caused by excessive differential pressure.

BY-PASS: Condition resulting from the product flowing through a vessel other than through the media. Also a filtering system which filters only part of the stream on a continuous basis.

BY-PASS INSTALLATION: A system where part of the main flow is diverted to pass through a filter.

BY-PASS VALVE: Valve to pass the flow around the media or the vessel, usually activated at a given differential pressure setting.

C

CAKE: Solids deposited on the filter medium during filtration in sufficient thickness to be removed in sheets of sizable pieces. In many cases, cake may provide its own filter media by adding to the surface of media. Also referred to as discharged solids or residue.

CANISTER: Container or mounting mechanism for elements.

CAPACITY: Volume of product which a vessel will accommodate. This is expressed in gallons or similar units. Also amount which will filter at a given efficiency and flow rate, expressed in gallons per minute or similar units.

CARTRIDGE: Removable medium used in a vessel to perform the function of coalescing, filtering, or separating. Also referred to as element, media, repack, etc. Made in a specified physical shape to be mounted by use of hardware designed for that purpose.

CARTRIDGE: The porous device, usually fitting in a filter housing, which performs the actual process of filtration.

CENTER PIPE: Component of a vessel which is used as a mount for cartridges. Made with perforated effect to accommodate flow. A center rod is used for the same purpose but is not perforated and does not accommodate flow.

CENTER-ROD: Components of a vessel used for mounting cartridges in the vessel. Usually made of a round bar material. A center pipe can also be used for the same purpose, but is made with perforated effect and directs flow through the cartridge.

CENTER SEAL: Part which forms seal between two elements when one element is on the top of another element. Can also be called an adaptor.

CENTER TUBE: Component of an element or cartridge which supports the media at the center or smallest diameter.

CENTIPOISE: One one-hundredth of a poise. A poise is the unit of viscosity expressed as one dyne per second per square centimeter.

CENTISTOKE: One one-hundredth of a stoke. A stoke is equal to the viscosity in poises times the density of the fluid in grams per cubic centimeter.

CHANNEL: To cut grooves or lines in or through the solids deposited on the media, or through the media itself. Also may be described as a break-through in the media which would result in a by-pass.

CLEANER BLADES: Stationary blades located between stacked discs of a metallic self cleaning filter cartridge to comb out dirt particles as the cartridge is rotated.

CLOUD POINT: Temperature of a petroleum oil at which paraffin, wax or other solid substances begin to crystallize out or separate from solution when the oil is chilled under definite prescribed conditions.

COAGULANT: That which produces agglomeration of suspended solids.

COALESCER: A mechanical device which unites discrete droplets of one phase prior to being separated from a second phase. Can be accomplished only when both phases are immiscible. Requires a tight media which is preferentially wettable and, by its nature of being tight, the media is also a good filtering material. Good coalescing permits gravity separation of the discontinuous phase. Coalescing may be accomplished by only a coalescer cartridge when the specific gravities of the two phases are widely separated. As the gravities difference become less, the two stage principle is generally required where finely coalesced discontinuous droplets are repelled by the second stage separator cartridge.

COALESCING: The action of uniting of small droplets of one liquid preparatory to its being separated from another liquid.

COLLAPSE PRESSURE: The pressure impressed across a filter element (cartridge), sufficient to cause collapse of the element.

COMBINATION: A filter medium composed of two or more types, grade or arrangements of filter media to provide proportion which are not available in a single filter medium.

CONTAMINANT: Anything in the fluid that should not be there.

CONTAMINATE: The foreign matter in a fluid which is accumulated from various sources such as system dirt, residue from wear of moving parts, atmospheric solids which settle in an open system. Contaminates tend to discolor a liquid, cause additional wear on moving parts, cause system upsets in process stream, or reduce the efficiency of a fluid. Water as well as solid may be considered a contaminate when the presence of water causes adverse results. The presence of contaminates, whether liquid or solid, is the basis on which the use of filters or separator/filters are sought.

CORE: Material used for the center of an element, generally of the wound design. May also be called a center tube when used in the coalescer, separator, or other type filter element.

CORROSION: The conversion of metals into oxides, hydrated oxides, carbonates, or other compounds due to the action of air or water, or both. Salts and sulphur are also important sources of corrosion. Removal of solids and water reduces the effect or speed of corrosion in many cases; and in other cases, corrosion inhibitors are used to reduce the effect of corrosion.

CP: A section of less dense material in the media which allow a cold liquid to flow through the element controlling pressure drop below bypass opening.

D

DEGRADATION: Wearing down, or reduction in the efficiency, of a media.

DEGREE OF FILTRATION: Fineness of a filter medium-size of the smallest particles filtered out.

DELTA "P": A Symbol (P) designating pressure drop. The difference in pressure between two points, generally measured at the inlet and outlet of a filter, separator/filter, etc. Normally measured in pounds per square inch (psi), inches of mercury (In. Hg.), or inches of water (In. H20).

DENSITY: The weight per unit volume of a substance (specific weight).

DEPTH: A filter medium which primarily retains contaminants within the tortuous passages within the thickness of the element wall.

DEPTH TYPE FILTRATION: Filtration accomplished by flowing a fluid through a mass filter media providing a tortuous path with many entrapments to stop the contaminates. Flow may be cross flow such as from the outside to inside and then down the center of an element, or from end to end. Certain types of solids, or combinations of solids, do not lend to surface filtration and depth type filtration is found to be more suitable.

DETERGENT OILS: Lubricating oils possessing special sludge dispersing properties commonly used in internal combustion engines. These properties are incorporated in the oil by the use of special additives.

DIELECTRIC: A substance which will not conduct electricity.

DIFFERENTIAL PRESSURE: The difference in pressure between two given points of a filter, separator/filter, etc.

DILATANT: A flow condition where certain liquids will show an increase in viscosity as the rate of shear or flow volume is increased.

DIRT HOLDING PRESSURE: The volume of contaminate an element can hold before reaching the maximum allowable pressure drop. Volume will vary depending on the size and design of the element and the density of the solid particles. Usually reported by weight such as grams or pounds per element. Also called solids retention or solids holding capacity.

DISCHARGE: Flow rate through a filter.

DISPOSABLE: Describes element which is to be discarded after use and replaced with an identical element. Same as replaceable. Opposite of reusable.

DUAL DENSITY: A depth element that is constructed of two different medias not blended into a homogeneous mixture but remaining as two different distinctive medias.

DROP: The quantity of fluid which falls into one spherical mass; a liquid globule. May also be described as several to many droplets.

DROPLET: A minute drop which mates to form larger drops capable of falling by gravity.

E

EDGE FILTER: Filter using shearing edges to separate solids from a liquid by shearing the oil film surrounding the particles (solid particles).

EDGE TYPE: Applies to liquid filters constructed of metal or paper discs, or specially constructed wire wound cylinders; contaminants are entrapped at the edges of the medium. Generally used to remove small quantities of very fine particles. Some have knife or blade cleaners to remove the accumulated solids.

EFFECTIVE AREA: The area of a medium that is exposed to flow and usable for its intended purpose: coalescing, filtering, or separating. Opposite of blind spots or dead area.

EFFECTIVE OPEN AREA: Area of the filtering medium through which the fluid may flow.

EFFICIENCY: Degree to which element will perform in removing solids and/or liquids. Output divided by input.

ELEMENT: Medium used in vessel to perform the function of coalescing, filtering, or separating. Also referred to as a cartridge, repack, etc. The porous device which performs the actual process of filtration.

ELEMENT BY-PASS VALVE: A valve within a filter to limit the differential pressure which can be impressed across the filter element.

EMULSIFICATION: A dispersion of one substance in the form of minute drops within another substance.

EMULSION: A dispersion of fine liquid particles in a liquid stream which do not necessarily dissolve in each other but are held in suspension. Many emulsions may be broken by coalescing if the liquids are immiscible. Emulsion stabilizers modify the surface tension of the droplets which makes coalescing difficult, if not impossible.

ENTRAINED WATER: Discrete water droplets carried by a continuous liquid or gas phase when water is immiscible with the liquid. May be separated from the continuous phase by coalescing and gravity separation. Usually picked up in a system by condensation or a water washing used in process.

ENTRAINMENT: Mist, fog, or droplets of a liquid which is usually considered to be a contaminate when used in the filtration industry.

EXTENDED AREA: Principal of shaping the element to give it more effective area than a simple cylinder of the same size.

F

FELTED ELEMENT: Constructed by random layer of fibers, usually strengthened by a resin binder.

FIBER: Flexible material with two relatively small dimensions and one long dimension.

FILTER: A term generally applied to a device used to remove solid contaminate from a liquid or gas, or separate one liquid from another liquid or gas. A filter, as referred to in the industry today, is a device which removes contaminates. If a device is used to remove solids and liquids contaminates, it is referred to in general terms as a separator, separator/filter, or entrainment separator. A filter may be one of a number of such types as replaceable cartridge, cyclone, edge, leaf, baffle, plate and frame, pre-coat, and centrifuge. The term filter is sometimes erroneously used to describe the media used inside the vessel or filter case, but the correct use should be filter element, cartridge, etc.

FILTER/COALESCER: Single stage vessel for coalescing and separating one immiscible fluid from another and the removal of solids. Generally recommended for use where continuous phase has light gravity. Available with various efficiencies.

FILTER EFFICIENCY: Expressed as a percent of contaminant introduced to the system, it is the ability of a filter to remove specified contaminants at a given contaminant concentration under specified test condition.

FILTER ELEMENT LIFE: Span of operation from clean unit to a predetermined pressure drop build up - usually measured in lapsed time.

FILTER LIFE: Span of operation from start to complete plugging usually measured in hours of operation.

FILTER MEDIUM: The porous material mounted on a plate or frame which separates the solids from the liquids in filtering. Also referred to as filter cloth, filter plate, or septum. The material that performs the actual process of filtration.

FILTRATE: Filtered fluid which flows out of a filter.

FILTRATION RATING, ABSOLUTE: The diameter of the largest hard spherical particle that will pass through a filter under specified test conditions. This is an indication of the largest opening in the filter medium.

KARL FISCHER: Analytical method of determining amount of water present in a sample by titration.

FLOW CHARACTERISTICS: The nature of fluid movement as being turbulent, laminar, constant or variable rate to various degrees.

FILTRATION RATING, MEAN: A measurement of the average size of the pores of the filter medium.

FILTRATION RATING, NOMINAL MICRON: An arbitrary micron value indicated by the manufacturer. Often defined: 95% of all particles this size, and larger, retained by the filter medium.

FLOW RATE: The rate at which a product is passed through a vessel or system; generally expressed as gallons per minute, barrels per hour, barrels per day, actual or standard cubic feet per minute, hour, day, etc.

FLUID: A liquid or gas which can be filtered by passing through a filter.

FREE WATER: Water entrained in a lubricating oil or fuel forming two distinct phases with the fluid and having a tendency to separate as a result of the differences in densities.

FULL FLOW: Product flow through the vessel at the rate for which the vessel is designed to operate. Also refers to all products passing through a medium. The opposite of a by-pass filter which is designed to filter only a portion of the stream on a continuous basis.

FULL FLOW FILTRATION: System which provides for filtering all the fluid which is pumped to or from wear surfaces or work stations each pass.

G

GAGE PRESSURE: All pressure greater than atmospheric pressure - as read on a pressure gage.

GAS SCRUBBER: A vessel designed to remove liquid and solid contaminates by impingement on a series of baffles or demister pads. Accomplished by drastic reduction of velocity as the gas enters the scrubber. Recent advances made in entrainment separation would expand the general use of the term to include mechanical cartridge type separators.

GEL: A semi-solid susceptible to pressure deformation. Has habit of sticking to surfaces.

GRADUAL DENSITY: A media of different densities. One media of a dense type packed around the center tube with a media of less density around the outside. Both medias are tapered at opposite directions. This allows high flow through the less dense media and tighter filtration through the dense media. Similar to the CP element in performance.

GRAM LIFE: Grams weight of contaminant introduced to a filter element at controlled rate to a determined differential pressure.

GRAVIMETRIC EFFICIENCY: Measure of efficiency in terms of weight.

H

HOLDING CAPACITY: In general usage refers to the amount of solids, particulate or foreign material one or more elements is capable of retaining up to the terminal or maximum differential pressure. Also can refer to volumetric holding capacity of either a solid or a liquid.

HOUSING: Container for a filter element (s).

HYDRAULIC FILTER, DUAL: A hydraulic filter having two filter elements in parallel.

HYDRAULIC FILTER, DUPLEX: An assembly of two hydraulic filters with valving for selection of either or both filters.

HYDRAULIC FILTER, FULL FLOW: A hydraulic filter, which under specified conditions filters all influent flow.

HYDRAULIC FILTER, TWO STAGE: A hydraulic filter having two filter elements in series.

HYDRAULICS: The study of fluids at rest or in motion.

HYDROPHILIC: Water accepting or water wetting. Having an affinity for water. Capable of uniting with or dissolving in water. Effective coalescing requires a media to have hydrophilic characteristics which cause free or entrained water to commingle into droplets which, when mated with other droplets, form into drops which separate by gravity. Opposite of hydrophobic.

HYDROPHOBIC: Non-water wetting. Having an antagonism for water. Not capable of uniting or mixing with water. Hydrophobic features are induced in the process of cellulose manufacture. Opposite of hydrophilic.

HYDROSTATIC TEST: A test conducted with either air, water, or other fluids at a given value over design pressure, to prove the structural integrity of a pressure vessel.

I

IMMISCIBLE: Incapable of being mixed; insoluble; opposite of miscible.

IMPREGNATION: Process of treating a coarse filter medium with resins.

IMPURITY: See "contaminant" - any undesirable material in the fluid.

INDICATOR, BY-PASS: An indicator which signals alternate flow.

INDICATOR DIFFERENTIAL PRESSURE: An indicator which signals the difference in pressure at two points.

INITIAL PRESSURE DROP: Loss in differential pressure between two points upon the start of flow through a vessel using new elements.

IN-LINE: Describes inlet and outlet connections which are positioned at the same height on opposite sides of a vessel so that an imaginary straight line can be drawn connecting one to the other. Also describes a small filtration unit that fits into a line and forms a similar image to the line, as in the case of a hose.

INSOLUBLE: Incapable of being dissolved in a fluid; opposite of soluble.

INTERFACE: Surface over which continuous phase and discontinuous phase are in contact.

IMPINGEMENT: The direct high velocity impact of the fluid flow upon or against an internal portion of the filter.

K

KEROSENE: A petroleum liquid used as a fuel for commercial jet powered aircraft, or for heating purposes.

KNIFE EDGE PLEATS: The sharply defined creases at the outer edge of a pleated element.

L

LACQUER: A natural or synthetic resin which is dissolved in a suitable solvent such as hydrocarbon oil rich in aromatics. When applied, the oil solvent evaporates, leaving behind a lacquer film.

LINE SIZE: The size of line used to carry the product in a system, such as a six-inch line.

LUBRICATION: Substituting fluid friction for solid friction by inserting oil between two moving parts.

M

MAGNETIC SEPARATOR: A separator that uses
a magnetic field to attract and hold ferro magnetic particles.

MATRIX: The structural support yarn or twine in wound elements is usually wound in a diamond.

MAXIMUM DIFFERENTIAL PRESSURE: The highest pressure differential which an element is required to withstand without structural failure or collapse.

MAXIMUM OPERATING PRESSURE: The maximum pressure allowed in a system.

MEDIA: Plural of medium. Material of which elements are made.

MEDIA (MEDIUM): A porous or slotted mass in
a filter element to separate solids from a fluid by difference in size of openings and contaminant.

MEDIA MIGRATION: Carry-over of fibers from filter, separator elements, or other filter material into the effluent. Less definitive than fiber migration and is quantitative.

MEDIUM: The principle component of an element. A material of controlled pore size or mass through which a product is passed to remove foreign particles held in suspension or to repel droplets of coalesced water; or material without controlled pore size such as glass fiber mats which contribute to filtration, coalescence, or separation of two immiscible liquids.

MEMBRANE: In filtration the term membrane is used to describe the media through which the liquid stream is to be passed or exchanged. Membranes are normally associated with ion exchanged media such as dialysis, osmosis, diffusion, etc., although filter paper itself could be classed as a membrane.

MERCAPTANS: Unsaturated sulphurs.

MICRON: A short unit of length in the metric system. One millionth of a meter, 10-4 centimeter, 10-3 millimeter, or 0.000039 of one inch. Used as a criterion to evaluate the performance or efficiency of a filter media or to describe the condition of either the influent or effluent. Usually stated in terms of being either absolute or nominal. Nominal micron rating is generally taken to mean that 98% of all articles over a given micron value have been removed by a specific media or medium. Absolute micron rating is generally taken to mean that all particles over a given micron value have been removed. The naked eye can see a particle 40 microns or larger.

MIGRATION: Contaminant or media released to pass downstream from filter element.

MMSCFD: Million Standard Cubic Feet per Day.

MMSCFH: Million Standard Cubic Feet per Hour.

MMSCFM: Million Standard Cubic Feet per Minute.

MODULAR: A filter element which has no separate housing of its own, but whose housing is incorporated into the equipment which it services. It may also incorporate a suitable enclosure for the filter cavity.

N

NEWTONIAN: A liquid which does not change in viscosity with a change in rate of shear, agitation or flow rate.

NPT: National Pipe Thread Standard.

NTP: Normal conditions of temperature and pressure. Whenever this term is used, it refers to a gas measured at pressure one (1) atmosphere absolute (760 mm. of Hg.) and a temperature of 0°C. However, some sources use a different reference temperature to define NTP.

OPEN AREA RATIO: The ratio of pore area of a filter medium expressed as a percent of total area.

OPERATING PRESSURE: The normal pressure at which a system operates.

OPERATING PRESSURE, CRITICAL: Pressure above the normal or design limits which may cause damage or rupture.

OPERATING PRESSURE, MAXIMUM: The maximum pressure allowed in the system.

OUTER SHELL: Outer covering of element, usually perforated or screen.

OUTER WRAP: Outside covering of an element.

OUTSIDE IN: Flow of product from outside to inside of an element.

PAPER: Medium used in many elements. A very general term applied to resin impregnated cellulose. Many types of paper or cellulose are used as filter media made to specifications.

PARTIAL FLOW: See "by-pass installation" - a system that diverts part of the main flow and passes it through a filter.

PARTICLE COUNT: A practice of counting particles of solid matter in groups based on relative size. Frequently used in engineering, a filter to a specific task or to evaluate the performance of a filter under specific operating conditions. When used as data to engineer a filter, proper consideration can be given to the type of media to be used, expectant life of the media, and the true cost of operation.

PARTICLE SIZE DISTRIBUTION: A tabulation resulting from a particle count of solids grouped by specified micron sizes to determine the condition of either the influent or effluent stream. Usually expressed in percentage of total solids to the specific group. Example: 31% in the 6 to 10 micron group. See particle count.

PERCENT FREE AREA: Quantitatively, proportion of an element's surface area.

PLAIN: A filter element whose medium is not pleated or otherwise extended, and has the geometric shape of a cylinder, cone disc, plate, etc.

PLEATED: A filter element whose medium consists of a series of uniform folds and has the geometric shape of a cylinder, cone, disc, plate, etc.

PLASTISOL: A suspension of thermosetting plastic which can be molded into any desired shape. Used as a combination end cap and gasket on element.

PLUGGED: Condition of a filter when it has collected its full capacity of contaminants and will not pass any more fluid.

POROSITY: The ratio of void volume to total cake volume. Also describes filter media which may have larger pores than other media.

POUR POINT: The lowest temperature at which a liquid will pour or flow without disturbance under specified conditions.

PRE-COAT: A filter medium in loose powder form, such as Fuller's or Diatomaceous earth, introduced into the upstream fluid to condition a filter element.

PREFILTER: Filter for removing gross contaminate before the product stream enters a separator/filter.

PRESSURE: The force exerted per unit area by a fluid.

PRESSURE ABSOLUTE: Gage pressure plus 14.7 psi.

PRESSURE ATMOSPHERIC: The force exerted by the atmosphere at sea level, which is equivalent to 14.7 psi.

PRESSURE DIFFERENTIAL: The difference in pressure between two points.

PRESSURE DROP: The difference in pressure between two points, generally at the inlet and outlet of a filter or a separator/filter. Measured in pounds per square inch gage, or inches of mercury.

PRESSURE RATING, OPERATING: The normal pressure at which a filter housing is capable of operating at specified operating conditions.

PRESSURE RELIEF: Valve which permits enough liquid or gas to escape from the vessel to prevent extreme pressure build up within the vessel.

PSI: Pounds per Square Inch.

PSIA: Pounds per Square Inch Absolute.

PSID: Pounds per Square Inch Differential.

PSIG: Pounds per Square Inch Gage.

R

RATE OF FLOW: The rate at which a product is passed through a vessel or system; generally expressed as gallons per minute, barrels per hour, barrels per day, actual or standard cubic feet per minute, hour, day, etc. Same as flow rate.

RATED FLOW: Normal operating flow rate at which a product is passed through a vessel; flow rate which a vessel and media are designed to accommodate.

REPLACEABLE: Describes element which is to be removed after use and replaced with an identical element.

REPLACEMENT ELEMENT: An element or a cartridge used to replace a disposable which has been loaded to its capacity with (cartridge) contaminants.

REUSABLE: Describes element which may be cleaned and used again. Opposite of disposable or replaceable.

S

SAE: Society of Automotive Engineers.

SAE NUMBER: A classification of lubricating oils for crankcase and transmissions in terms of viscosity as standardized by the Society of Automotive Engineers.

SAYBOLD SECONDS UNIVERSAL (SSU): Units of viscosity as measured by observing the time in seconds required for 60 ml. of a fluid to drain through a tubular orifice 0.483 inches long by 0.0695 inches in diameter at stated conditions of temperature, and pressure.

SCFD: Standard Cubic Feet per Day.

SCFH: Standard Cubic Feed per Hour.

SCFM: Standard Cubic Feet per Minute.

SELF CLEANING: A filter element designed to be cleaned without removing it from the filter assembly, or interrupting flow.

SEPARATION: The action of separating solids or liquids from fluids. May be accomplished by impingement, filtration, or by coalescing. The term "separation" is used in some circles when referring to the separation of liquids. Also used to describe the action in the second stage of two-stage separation.

SEPARATOR: A device whose primary function is to isolate contaminants by physical properties other than size.

SEPARATOR/FILTER: Vessel which removes solids and entrained liquids from another liquid or gas. Uses some combination of a baffle and/or coalescer, filter, or separator element. May be single stage, two stage, or single or two stage with prefilter section for gross solids removal. Common application is the removal of water from gas or another immiscible liquid. General reference to term applies the equipment is capable of both separation and filtration to specific degrees of efficiencies.

SERVICE LIFE: The length of time an element operates before reaching the maximum allowable pressure drop.

SHELL: Outer wall of a vessel. Also referred to as body.

SHUNT INSTALLATION: A system with a filter paralleled by a metering device both in the main supply line.

SINTERED: Media, usually metallic, processed to cause diffusion bonds at all contacting points, retaining openings the passage of filtrate.

SKID MOUNTED: Describes one or more vessels with pump and motor, all mounted on a portable platform.

SLOT AREA: Sum of the area of all the fluid path openings in a metal - edge filter element.

SLUDGE: Dirt, carbon, water and chemical compounds as found in oils.

SOLID SUSPENSION: A mixture of solids suspended in a fluid.

SOLIDS: A mass, or matter, contained in a stream which is considered undesirable and should be removed.

SOLUTION: A single phase combination of liquid and non-liquid substances, or two or more liquids.

SPACING: The distance between adjacent surfaces of stacked discs, edge wound ribbons, or single layer filaments. This dimension determines the smallest dimension of solid particles to be retained.

SPECIFIC GRAVITY: Ratio of substance's weight to that of some standard substance. (Water for liquids and solids, air or hydrogen for gases)

SURFACE: A filter medium which primarily retains contaminant on the influent face.

SURFACE AREA: Total area of an element that is exposed to approaching flow. See "percent free area".

SURFACTANTS: Coined expression for surface active agents which are sometimes called emulsifiers or wetting agents. First appeared in hydrocarbons with the advent of the catalytic cracking process in refining. Caused by the forming of sodium sulfonate and sodium naphthanate molecules. Affects liquid/liquid separation by reducing interfacial tension and forming into a slime which binds off the fibers used in coalescing media.

SURGE: The peak system pressure rise measured as a function of restricting or blocking fluid flow.

SUSPENSION: Solids or liquids held in other liquids.

SUSPENDED SOLIDS: Non-settled particles in fluid.

SWING BOLT: A type of vessel closure which reduces service time. Opposite of thru-bolt flange where studs and nuts are used, such as with ASA type flanges.

T

THIXOTROPIC: A liquid which shows a marked reduction in viscosity as the rate of shear, agitation, or flow rate is increased.

TORTUOSITY: The ratio of the average effective flow path length to minimum theoretical flow path length (thickness) of a filter medium.

TURBID METRIC EFFICIENCY: (Filter inlet turbidity - Outlet turbidity/by Inlet turbidity.

TURBIDITY: Stirred up sediment or contaminant in a fluid.

TURN-OVER: Number of times the contents of the system pass through a filter per unit time.

U

ULTRAFILTER: Membrane type to remove very fine suspended submicronic particles as well as some dissolved solids.

UNLOADING: Release downstream of trapped contaminate, due to change in flow rate, mechanical shock and vibration, or as excessive pressure builds up, or media failure.

V

VACUUM: Reference to pressure below atmospheric.

VISCOSITY: Degree of fluidity; property of fluid's molecular structure by virtue of which they resist flow. The resistance of flow exhibited by a liquid resulting from the combined effects of cohesion and adhesion. The units of measurement are the poise and the stoke. A liquid has a viscosity of one poise if a force of one dyne per square centimeter causes two parallel liquid surfaces one square centimeter in area and one centimeter apart to move past one another at a rate of one centimeter per second. There are a great many crude and empirical methods for measuring viscosity which generally involve measurement for the time of flow or movement of a ball, ring, or other object in a specially shaped or sized apparatus. The internal molecular friction of a liquid, or that property which resists any force tending to produce flow.

W

WOUND: A filter medium comprised of two or more layers of helical wraps of a continuous strand or filament in a predetermined pattern.

WOVEN: A filter medium made from strands of fiber, thread, or wire interlaced into a cloth on a loom.

Chemical Resistance Guide

MAXIMUM RECOMMENDED OPERATING TEMPERATURES

GASKET MATERIALS	BUNA N	250°F
	ETHYLENE PROPYLENE	350°F
	VITON	450°F
	TEFLON	500°F
FILTER MEDIA	POLYESTER	300°F
	POLYPROPYLENE	180°F
	NYLON	325°F
HOUSING MATERIALS	CARBON STEEL	400°F
	304 STAINLESS STEEL	400°F
	316 STAINLESS STEEL	400°F
	PVC	150°F
	POLYPROPYLENE	150°F

NOTES: *Maximum temperature at standard vessel design pressure.*
For higher temperatures consult Rosedale Products, Inc.

Key

- ● = Recommended for most conditions up to the maximum temperature of the material.
- ● = Fair. May be acceptable, but testing is recommended.
- ● = Not recommended.
- **O** = No data available. Customer testing required.

Number (i.e. 70) = Maximum temperature in degrees F°
